THIS SPEC IS OBSOLETE

Spec No: 002-08554

Spec Title: MB3793-30A POWER VOLTAGE MONITORING IC WITH WATCHDOG TIMER DATASHEET

Replaced by: None
Description

The MB3793 is an integrated circuit to monitor power voltage; it incorporates a watchdog timer.

A reset signal is output when the power is cut or falls abruptly. When the power recovers normally after resetting, a power-on reset signal is output to microprocessor units (MPUs). An internal watchdog timer with two inputs for system operation diagnosis can provide a fail-safe function for various application systems.

Features

- Precise detection of power voltage fall: ±2.5%
- Detection voltage with hysteresis
- Low power dispersion: $I_{CC} = 31 \mu A$ (reference)
- Internal dual-input watchdog timer
- Watchdog-timer halt function (by inhibition pin)
- Independently-set watchdog and reset times
- Three types of packages (SOP-8pin): 2 types

Application

- Arcade Amusement etc.

4. Block Description

1. Comp. S

Comp. S is a comparator with hysteresis to compare the reference voltage with a voltage ($V_S$) that is the result of dividing the power voltage ($V_{CC}$) by resistors 1 and 2. When $V_S$ falls below 1.24 V, a reset signal is output. This function enables the MB3793 to detect an abnormality when the power is cut or falls abruptly.

2. Output Circuit

The output circuit contains a \texttt{RESET} output control comparator that compares the voltage at the CTP pin to the threshold voltage to release the \texttt{RESET} output if the CTP pin voltage exceeds the threshold value. Since the reset (\texttt{RESET}) output buffer has CMOS organization, no pull-up resistor is needed.

3. Pulse Generator

The pulse generator generates pulses when the voltage at the CK1 and CK2 clock pins changes to High from Low level (positive-edge trigger) and exceeds the threshold voltage; it sends the clock signal to the watchdog timer.

4. Watchdog Timer

The watchdog timer can monitor two clock pulses. Short-circuit the CK1 and CK2 clock pins to monitor a single clock pulse.

5. Inhibition Pin

The inhibition (INH) pin forces the watchdog timer on/off. When this pin is High level, the watchdog timer is stopped.

6. Logic Circuit

The logic circuit contains flip-flops.

Flip-flop RSFF1 controls the charging and discharging of the power-on reset hold time setting capacitor ($C_{TP}$).

Flip-flop RSFF2 turns on/off the circuit that accelerates charging of the power-on reset hold time setting capacitor ($C_{TP}$) at a reset. The RSFF2 operates only at a reset; it does not operate at a power-on reset when the power is turned on.

*: The watchdog timer monitor time range depends on the rating of the setting capacitor.

WARNING:
1. The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated under these conditions.
2. Any use of semiconductor devices will be under their recommended operating condition.
3. Operation under any conditions other than these conditions may adversely affect reliability of device and could result in device failure.
4. No warranty is made with respect to any use, operating conditions or combinations not represented on this data sheet. If you are considering application under any conditions other than listed herein, please contact sales representatives beforehand.

8. Diagram

Figure 1. Basic Operation (Positive Clock Pulse)
Figure 2. Basic Operation (Negative Clock Pulse)
Figure 3. Single-clock Input Monitoring (Positive Clock Pulse)

Note: The MB3793 can monitor only one clock. The MB3793 checks the clock signal at every other input pulse. Therefore, set watchdog timer monitor time $t_{WD}$ to the time that allows the MB3793 to monitor the period twice as long as the input clock pulse.
Figure 4. Inhibition Operation (Positive Clock Pulse)
9. Operation Sequence

1. Positive Clock Pulse Input
   Refer to Figure 1 under “8. Diagram”.

2. Negative Clock Pulse Input
   Refer to Figure 2 under “8. Diagram”.

The MB3793 operates in the same way whether it inputs positive or negative pulses.

3. Clock Monitoring
   To use the MB3793 while monitoring only one clock, connect clock pins CK1 and CK2.

Although the MB3793 operates basically in the same way as when monitoring two clocks, it monitors the clock signal at every other input pulse.

Refer to Figure 3 under “8. Diagram”.

4. Description of Operations
   The numbers given to the following items correspond to numbers (1) to (13) used in “8. Diagram”.

   (1) The MB3793 outputs a reset signal when the supply voltage ($V_{CC}$) reaches about 0.8 V ($V_{CCL}$).

   (2) If $V_{CC}$ reaches or exceeds the rise-time detected voltage $V_{SH}$, the MB3793 starts charging the power-on reset hold time setting capacitor $C_{TP}$. At this time, the output remains in a reset state. The $V_{SH}$ value is 3.07 V (Typ)
(3) When \( C_{TP} \) has been charged for a certain period of time \( T_{PR} \) (until the \( C_{TP} \) pin voltage exceeds the threshold voltage \( V_{th} \) after the start of charging), the MB3793 cancels the reset (setting the \( \text{RESET} \) pin to "H" level from "L" level).

The \( V_{th} \) value is about 2.4 V with \( V_{CC} = 3.3 \) V. The power-on reset hold time \( t_{PR} \) is set with the following equation:

\[
 t_{PR} (\text{ms}) = A \times C_{TP} (\mu\text{F})
\]

The value of \( A \) is about 750 with \( V_{CC} = 3.3 \) V. The MB3793 also starts charging the watchdog timer monitor time setting capacitor \( C_{TW} \).

(4) When the voltage at the watchdog timer monitor time setting pin \( C_{TW} \) reaches the "H" level threshold voltage \( V_{h} \), the \( C_{TW} \) switches from the charge state to the discharge state. The value of \( V_{h} \) is always about 1.24 V regardless of the detected voltage.

(5) If the CK2 pin inputs a clock pulse (positive edge trigger) when the \( C_{TW} \) is being discharged in the CK1-CK2 order or simultaneously, the \( C_{TW} \) switches from the discharge state to the charge state. The MB3793 repeats operations (4) and (5) as long as the CK1/CK2 pin inputs clock pulses with the system logic circuit operating normally.

(6) If no clock pulse is fed to the CK1 or CK2 pin within the watchdog timer monitor time \( t_{WD} \) due to some problem with the system logic circuit, the \( C_{TW} \) pin is set to the "L" level threshold voltage \( V_{L} \) and the MB3793 outputs a reset signal (setting the \( \text{RESET} \) pin to "L" level from "H" level). The value of \( V_{L} \) is always about 0.24 V regardless of the detected voltage.

The watchdog timer monitor time \( t_{WD} \) is set with the following equation:

\[
 t_{WD} (\text{ms}) = B \times C_{TW} (\mu\text{F})
\]

The value of \( B \) is hardly affected by the power supply voltage; it is about 1600 with \( V_{CC} = 3.3 \) V.

(7) When a certain period of time \( t_{WR} \) has passed (until the \( C_{TP} \) pin voltage reaches or exceeds \( V_{th} \) again after recharging the \( C_{TP} \), the MB3793 cancels the reset signal and starts operating the watchdog timer. The watchdog timer monitor reset time \( t_{WR} \) is set with the following equation:

\[
 t_{WR} (\text{ms}) = D \times C_{TP} (\mu\text{F})
\]

The value of \( D \) is 55 with \( V_{CC} = 3.3 \) V.

The MB3793 repeats operations (4) and (5) as long as the CK1/CK2 pin inputs clock pulses. If no clock pulse is input, the MB3793 repeats operations (6) and (7).

(8) If \( V_{CC} \) is lowered to the fall-time detected voltage \( (V_{SL}) \) or less, the \( C_{TP} \) pin voltage decreases and the MB3793 outputs a reset signal (setting the \( \text{RESET} \) pin to "L" level from "H" level). The value of \( V_{SL} \) is 3.0 V (Typ).

(9) When \( V_{CC} \) reaches or exceeds \( V_{SH} \) again, the MB3793 starts charging the \( C_{TP} \).

(10) When the \( C_{TP} \) pin voltage reaches or exceeds \( V_{th} \), the MB3793 cancels the reset and restarts operating the watchdog timer. It repeats operations (4) and (5) as long as the CK1/CK2 pin inputs clock pulses.

(11) Making the inhibit pin active (setting the INH pin to "H") forces the watchdog timer to stop operation.

This stops only the watchdog timer, leaving the MB3793 monitoring \( V_{CC} \) (operations (8) to (10)). The watchdog timer remains inactive unless the inhibit input is canceled. The inhibition (INH) pin must be connecting a voltage of more low impedance, to evade of the noise.

(12) Canceling the inhibit input (setting the INH pin to "L") restarts the watchdog timer.

(13) The reset signal is output when the power supply is turned off to set \( V_{CC} \) to \( V_{SL} \) or less.
1. Equation of time-setting capacitances \( C_{TP} \) and \( C_{TW} \) and set time

\[
\begin{align*}
\tau_{PR} \text{ [ms]} &= A \times C_{TP} \text{ [\mu F]} \\
\tau_{WD} \text{ [ms]} &= B \times C_{TW} \text{ [\mu F]} \\
\tau_{WR} \text{ [ms]} &= D \times C_{TP} \text{ [\mu F]}
\end{align*}
\]

*: Use a capacitor with less leakage current.

Figure 8. Supply Voltage Monitor and Watchdog Timer Stop

![Figure 8 Diagram]

*: Use a capacitor with less leakage current.
12. Notes on Use

- Take account of common impedance when designing the earth line on a printed wiring board.
- Take measures against static electricity.
  - For semiconductors, use antistatic or conductive containers.
  - When storing or carrying a printed circuit board after chip mounting, put it in a conductive bag or container.
  - The work table, tools and measuring instruments must be grounded.
  - The worker must put on a grounding device containing kΩ to 1 MΩ resistors in series.
- Do not apply a negative voltage.
  - Applying a negative voltage of $-0.3 \, \text{V}$ or less to an LSI may generate a parasitic transistor, resulting in malfunction.

13. Ordering Information

13.1 RoHS Compliance Information

The LSI products of Cypress with “E1” are compliant with RoHS Directive, and has observed the standard of lead, cadmium, mercury, Hexavalent chromium, polybrominated biphenyls (PBB), and polybrominated diphenyl ethers (PBDE).

The product that conforms to this standard is added “E1” at the end of the part number.

NOTES

1. ALL DIMENSIONS ARE IN MILLIMETER.

DIMENSIONING D INCLUDE MOLD FLASH, DIMENSIONING E1 DOES NOT INCLUDE INTERLEAD FLASH OR PROTRUSION. INTERLEAD FLASH OR PROTRUSIONS SHALL NOT EXCEED 0.025 mm PER SIDE. D AND E1 DIMENSION ARE DETERMINED AT DATUM H.

DATUMS A & B TO BE DETERMINED AT DATUM H.

6. "N" IS THE MAXIMUM NUMBER OF TERMINAL POSITIONS FOR THE SPECIFIED PACKAGE LENGTH.

THE DIMENSION APPLY TO THE FLAT SECTION OF THE LEAD BETWEEN 0.10 mm TO 0.25 mm FROM THE LEAD TIP.

DIMENSION "b" DOES NOT INCLUDE THE DAMBAR PROTRUSION. ALLOWABLE DAMBAR PROTRUSION SHALL BE 0.10 mm TOTAL IN EXCESS OF THE "b" DIMENSION AT MAXIMUM MATERIAL CONDITION. THE DAMBAR MAY NOT BE LOCATED ON THE LOWER RADIUS OF THE FOOT.

IF THIS CHAMFER FEATURE IS OPTIONAL, IF IT IS NOT PRESENT, THEN A PIN IDENTIFIER MUST BE LOCATED WITHIN THE INDEX AREA INDICATED

"A1" IS DEFINED AS THE VERTICAL DISTANCE FROM THE SEATING PLANE TO THE LOWEST POINT ON THE PACKAGE BODY EXCLUDING THE LID AND OR THERMAL ENHANCEMENT ON CAVITY DOWN PACKAGE CONFIGURATIONS.

To the extent permitted by applicable law, Cypress reserves the right to make changes to this document without further notice. Cypress does not assume any liability arising out of the application or use of any product or circuit described in this document. Any information provided in this document, including any sample design information or programming code, is provided only for reference purposes. It is the responsibility of the user of this document to properly design, program, and test the functionality and safety of any application made of this information and any resulting product. Cypress products are not designed, intended, or authorized for use as critical components in systems designed or intended for the operation of weapons, weapons systems, nuclear installations, life-support devices or systems, other medical devices or systems (including resuscitation equipment and surgical implants), pollution control or hazardous substances management, or other uses where the failure of the device or system could cause personal injury, death, or property damage (“Unintended Uses”). A critical component is any component of a device or system whose failure to perform can be reasonably expected to cause the failure of the device or system, or to affect its safety or effectiveness. Cypress is not liable, in whole or in part, and you shall and hereby do release Cypress from any claim, damage, or other liability arising from or related to any Unintended Uses of Cypress products. You shall indemnify and hold Cypress harmless from and against all claims, costs, damages, and other liabilities, including claims for personal injury or death, arising from or related to any Unintended Uses of Cypress products.

Cypress, the Cypress logo, Spansion, the Spansion logo, and combinations thereof, WICED, PSoC, CapSense, EZ-USB, F-RAM, and Traveo are trademarks or registered trademarks of Cypress in the United States and other countries.
