Please note that Cypress is an Infineon Technologies Company. The document following this cover page is marked as “Cypress” document as this is the company that originally developed the product. Please note that Infineon will continue to offer the product to new and existing customers as part of the Infineon product portfolio.

**Continuity of document content**
The fact that Infineon offers the following product as part of the Infineon product portfolio does not lead to any changes to this document. Future revisions will occur when appropriate, and any changes will be set out on the document history page.

**Continuity of ordering part numbers**
Infineon continues to support existing part numbers. Please continue to use the ordering part numbers listed in the datasheet for ordering.
The following document contains information on Cypress products. The document has the series name, product name, and ordering part numbering with the prefix “MB”. However, Cypress will offer these products to new and existing customers with the series name, product name, and ordering part number with the prefix “CY”.

**How to Check the Ordering Part Number**
2. Enter the keyword (for example, ordering part number) in the SEARCH PCNS field and click **Apply**.
3. Click the corresponding title from the search results.
4. Download the Affected Parts List file, which has details of all changes.

**For More Information**
Please contact your local sales office for additional information about Cypress products and solutions.

**About Cypress**
Cypress is the leader in advanced embedded system solutions for the world's most innovative automotive, industrial, smart home appliances, consumer electronics and medical products. Cypress' microcontrollers, analog ICs, wireless and USB-based connectivity solutions and reliable, high-performance memories help engineers design differentiated products and get them to market first. Cypress is committed to providing customers with the best support and development resources on the planet enabling them to disrupt markets by creating new product categories in record time. 1 Introduction

For the energy harvesting, the system design is very important. The system performing low power operation should be designed since the amount of energy from harvester is very small. In such cases, the energy budget calculation is necessary.

1.1 Energy Harvesting System

Figure 1 shows the popular energy harvesting system.

![Energy Harvesting System Diagram]

Low power consumption devices are needed to design the energy harvesting system. Select low power PMIC and ICs for the application block because the energy from harvester is limited.

Also, energy from harvester should be stored on the Cin and Cout to operate the application block. If the size of these capacitors were too big, it would take too much time to charge energy into these capacitors, and the system cannot be operated frequently. On the other hand, if these capacitors were too small, enough energy cannot be stored on these capacitors for the application block. The sizing of the Cin and Cout is important, too.
2 Energy Calculation

2.1 Energy Requirement in Application Block

Once the system is designed, make the prototype. The Figure 2 shows the measurement method of the energy requirement in application block.

Figure 2. Measurement of Energy Requirement

To calculate the necessary energy for the application, measure the voltage and current of VOUT. After the measurement, apply the following equation to calculate the energy requirement.

\[ E_{\text{Appl}} = V_{\text{Appl}} \times I_{\text{Appl}} \times t_{\text{Appl}} \]

The Figure 3 shows actual measurement waveform of the energy harvesting system. In this example, the energy requirement for the application block is roughly calculated at 2,534µJ.

Figure 3. Waveform of VOUT and IVOUT

Waveforms

\( \text{VOUT} \geq 2\text{V/DIV} \)

\( \text{IVOUT} \geq 10\text{mA/DIV} \)

Preset output voltage = 3.3V

MCU & Sensor

RF transmission

Application Operation starts

3.3V x 16mA x 48ms
= 2534µJ

16mA

48ms
2.2 Sizing of Cin and Cout (for MB39C811)
The Cin and Cout should be sized. The Figure 4 shows the image of the capacitors with the buck DC/DC converter, MB39C811.

Figure 4. Stored Image of Capacitors (for MB39C811)

The energy stored on a capacitor is calculated by the following equation.

\[ E_{\text{capacitor}} = \frac{1}{2} C V^2 \]

Because the energy in a capacitor is proportional to the square of the voltage, it is energetically advantageous for the buck DC/DC converter to make the Cin larger. On the other hand, for the boost DC/DC converter, it is energetically advantageous to make the Cout larger. In the example with MB39C811 of the Figure 4, adjust the Cin, and keep the Cout = 47\( \mu \)F (refer to the MB39C811 datasheet).

Calculate the available energy in Cout
The output power-good reset voltage (minimum voltage of the Cout) is 70 \% of the preset output voltage (VOUT voltage), VOPGL is 2.31V (refer to the MB39C811 datasheet).

Available energy in Cout \([\mu J]\) = \( \frac{1}{2} \times \text{Cout} \times (\text{VOUT}^2 - \text{VOPGL}^2) \)

\[ = \frac{1}{2} \times 47[\mu F] \times (3.3[V]^2 - 2.31[V]^2) = 131[\mu J] \]

In the Figure 3, the energy requirement for the application block was calculated at 2,534[\( \mu \)J]. The available energy stored on the Cout was found 131\( \mu \)J, so that the remaining energy requirement is

Remaining energy requirement \([\mu J]\) = 2,534[\( \mu \)J] - 131[\( \mu \)J] = 2,403[\( \mu \)J]

The remaining energy requirement should be stored on the Cin.

Calculate the size of the Cin
For the Cin calculation, it is necessary to take the efficiency of PMIC into account. According to the datasheet, the efficiency is about 80\% in the 16mA load current. (The “\( \eta \)” is the efficiency of PMIC.)

Available energy in Cin \([\mu J]\) = \( \frac{1}{2} \times \eta \times \text{Cin} \times (\text{UVLOH}^2 - \text{UVLOL}^2) \)

\[ 2403[\mu J] = \frac{1}{2} \times 80[\%] \times \text{Cin}[\mu F] \times (5.2[V]^2 - 4.0[V]^2) \]

\[ \text{Cin}[\mu F] = 544[\mu F] \]
2.3 Charging Time of Cin and Cout (for MB39C811)

In order to calculate the charging time, the power generation capability is needed. (Refer to the Appendix, e.g. a solar cell has 155µW generation capability at the 1000lx). The Figure 5 shows the example of energy harvesting system focused on the charging time with a harvester.

Figure 5. Charging Time of Cin and Cout (for MB39C811)

Step1 for Initial charging time

Before calculating the initial charging time, calculate the total energy stored on both Cin and Cout.

Total energy of Cin [µJ] = \(\frac{1}{2} \times Cin \times (VUVLOH)^2 = \frac{1}{2} \times 544[µF] \times 5.2[V]^2 = 7355[µJ]\)

Total energy of Cout [µJ] = \(\frac{1}{2} \times Cout \times (VOUT)^2 = \frac{1}{2} \times 47[µF] \times 3.3[V]^2 = 256[µJ]\)

Step2 for Initial charging time

Initial charging time of Cin [s] = \(\frac{\text{Total energy of Cin [µJ]}}{\text{Power of solar cell [µW]}} = \frac{7355[µJ]}{155[µW]} = 49.5[s]\)

Initial charging time of Cout [s] = \(\frac{\text{Total energy of Cout [µJ]}}{\text{Power of solar cell [µW] \times 80[\%]}} = \frac{256[µJ]}{155[µW] \times 0.8} = 2[s]\)

Initial charging time [s] = Initial charging time of Cin [s] + Initial charging time in Cout [s]

\[= 49.5 [s] + 2 [s] = 51.5 [s]\]

Repeat charging time

Repeat time for charging time of Cin [s] = \(\frac{\text{Available energy in Cin [µJ]}}{\text{Power of solar cell [µW]}} = \frac{2403[µJ]}{155[µW]} = 15.5[s]\)

Repeat charging time of Cout [s] = \(\frac{\text{Available energy in Cout [µJ]}}{\text{Power of solar cell [µW] \times 80[\%]}} = \frac{131[µJ]}{155[µW] \times 0.8} = 1[s]\)

Repeat charging time [s] = Repeat charging time of Cin [s] + Repeat charging time of Cout [s]

\[= 15.5 [s] + 1 [s] = 16.5 [s]\]
2.4 Sizing of Cin and Cout (for MB39C831)

The Figure 6 shows the image of the capacitors with the boost DC/DC converter, MB39C831.

Figure 6. Stored Image of Capacitors (for MB39C831)

Because the energy in a capacitor is proportional to the square of the voltage, it is energetically advantageous for the boost DC/DC converter to make the Cout larger. In the example with MB39C831 of the Figure 6, only adjust the Cout. Although the Cin = 10µF is used as the input capacitor, the Cin is excluded from the energy calculation because the stored energy on the Cin is very small.

In the Figure 3, the energy requirement for the application block was calculated at 2,534[µJ]. The energy requirement should be stored on the Cout.

**Calculate the size of the Cout**

The output power-good reset voltage (minimum voltage of the Cout) is set by 2.9V in MB39C831. (Refer to the MB39C831 datasheet).

Available energy in Cout [µJ] = \( \frac{1}{2} \times \text{Cout} \times (\text{VOUT}^2 - 2.9[V]^2) \)

\[ 2534[\mu J] = \frac{1}{2} \times \text{Cout}[\mu F] \times (3.3[V]^2 - 2.9[V]^2) \]

\[ \text{Cout}[\mu F] = 2044[\mu F] \]
2.5 Charging Time for Cin and Cout (for MB39C831)

In order to calculate the charging time, the power generation capability is needed. (Refer to the Appendix, e.g. the single crystal silicon solar cell (Vmax=0.5V) has 233µW generation capability including the MB39831’s consumption at the 50000[ lx]). The Figure 7 shows the example of energy harvesting system focused on the charging time with a harvester.

Figure 7. Charging Time of Cin and Cout (for MB39C831)

**Step1 for Initial charging time**

Before calculating the initial charging time, calculate the total energy stored on the Cout.(excluding the Cin because the stored energy on the Cin is very small.)

\[
\text{Total energy of Cout [µJ]} = \frac{1}{2} \times \text{Cout} \times (\text{VOUT}^2) = \frac{1}{2} \times 2044[µF] \times 3.3[V]^2 = 11127[µJ]
\]

**Step2 for Initial charging time**

Initial charging time of Cout [s] = \( \frac{\text{Total energy of Cout [µJ]}}{\text{generation capability including IC[µW]}} \) = \( \frac{11127 [µJ]}{233 [µW]} \) = 44.8[s]

**Repeat charging time**

Repeat charging time of Cout [s] = \( \frac{\text{Available energy in Cout [µJ]}}{\text{generation capability including IC[µW]}} \) = \( \frac{2534 [µJ]}{233 [µW]} \) = 11[s]
A Appendix

A.1 Power Generation Capability

To make it simple to calculate charging time at the section 2.3 and the section 2.5, the power generation capability is calculated based on the measured charging time of capacitors.

Table 1. Examples of Power Generation Capability (for MB39C811)

- VOUT = 3.3V
- BUCK DC/DC MB39C811
- Cin

VUVLOH : UVLO release voltage
VVOUT : Preset output voltage

Figure 10. Charging time for Cin and Cout

1. Charging energy in Cin
   Charging energy[µJ] = \( \frac{1}{2} \times Cin \times (VUVLOH)^2 \)
   \( = \frac{1}{2} \times 470[µF] \times 5.2[V]^2 = 6354[µJ] \)

2. Charging time in Cin (measured value)
   Charging time[s] = 41[s]

3. Power generation capability
   Power generation capability[µW] = Charging energy[µJ] \div Charging time[s]
   \( = 6354[µJ] \div 41[s] = 155[µW] \)

After the voltage of the Cout becomes the preset output voltage, more energy is charged into the Cin until the open circuit voltage of the solar cell. The power generation capability during the period is calculated.
1. **Charging more energy in Cin**

Charging energy\([\mu J]\) = \(\frac{1}{2} \times 80[\%] \times 470[\mu F] \times (6.4[V]^2 - 5.1[V]^2) = 3513[\mu J]\)

2. **Charging time in Cin (measured value)**

Charging time [s] = 100 [s]

3. **Power generation capability**

Power generation capability\([\mu W]\) = Charging energy\([\mu J]\) / Charging time [s]

\[= 3513[\mu J] / 100 [s] = 35[\mu W]\]

The power generation capability is much smaller than that until the Cin become the preset output voltage. That is because of the characteristics of the solar cell. This solar cell acts as a current source until around 5V (see Figure 13). However, the current supply suddenly decrease after the voltage goes over 5V.

This document, including any software or firmware included or referenced in this document ("Software"), is owned by Cypress under the intellectual property laws and treaties of the United States and other countries worldwide. Cypress reserves all rights under such laws and treaties and does not, except as specifically stated in this paragraph, grant any license under its patents, copyrights, trademarks, or other intellectual property rights. If the Software is not accompanied by a license agreement and you do not otherwise have a written agreement with Cypress governing the use of the Software, then Cypress hereby grants you a personal, non-exclusive, nontransferable license (without the right to sublicense) (1) under its copyright rights in the Software (a) for Software provided in source code form, to modify and reproduce the Software solely for use with Cypress hardware products, only internally within your organization, and (b) to distribute the Software in binary code form externally to end users (either directly or indirectly through resellers and distributors), solely for use on Cypress hardware product units, and (2) under those claims of Cypress's patents that are infringed by the Software (as provided by Cypress, unmodified) to make, use, distribute, and import the Software solely for use with Cypress hardware products. Any other use, reproduction, modification, translation, or compilation of the Software is prohibited.

TO THE EXTENT PERMITTED BY APPLICABLE LAW, CYPRESS MAKES NO WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, WITH REGARD TO THIS DOCUMENT OR ANY SOFTWARE OR ACCOMPANYING HARDWARE, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. TO THE EXTENT PERMITTED BY APPLICABLE LAW, CYPRESS RESERVES THE RIGHT TO MAKE CHANGES TO THIS DOCUMENT WITHOUT FURTHER NOTICE. CYPRESS DOES NOT ASSUME ANY LIABILITY ARISING OUT OF THE APPLICATION OR USE OF ANY PRODUCT OR CIRCUIT DESCRIBED IN THIS DOCUMENT. ANY INFORMATION PROVIDED IN THIS DOCUMENT, INCLUDING ANY SAMPLE DESIGN INFORMATION OR PROGRAMMING CODE, IS PROVIDED ONLY FOR REFERENCE PURPOSES. IT IS THE RESPONSIBILITY OF THE USER OF THIS DOCUMENT TO PROPERLY DESIGN, PROGRAM, AND TEST THE FUNCTIONALITY AND SAFETY OF ANY APPLICATION MADE OF THIS INFORMATION AND ANY RESULTING PRODUCT. CYPRESS PRODUCTS ARE NOT DESIGNED, INTENDED, OR AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN SYSTEMS DESIGNED OR INTENDED FOR THE OPERATION OF WEAPONS, WEAPONS SYSTEMS, NUCLEAR INSTALLATIONS, LIFE-SUPPORT DEVICES OR SYSTEMS, OTHER MEDICAL DEVICES OR SYSTEMS (INCLUDING RESUSCITATION EQUIPMENT AND SURGICAL IMPLANTS), POLLUTION CONTROL OR HAZARDOUS SUBSTANCES MANAGEMENT, OR OTHER USES WHERE THE FAILURE OF THE DEVICE OR SYSTEM COULD CAUSE PERSONAL INJURY, DEATH, OR PROPERTY DAMAGE ("UNINTENDED USES"). A CRITICAL COMPONENT IS ANY COMPONENT OF A DEVICE OR SYSTEM WHOSE FAILURE TO PERFORM CAN BE REASONABLY EXPECTED TO CAUSE THE FAILURE OF THE DEVICE OR SYSTEM, OR TO AFFECT ITS SAFETY OR EFFECTIVENESS. CYPRESS IS NOT LIABLE, IN WHOLE OR IN PART, AND YOU SHALL AND HEREBY DO RELEASE CYPRESS FROM ANY CLAIM, DAMAGE, OR OTHER LIABILITY ARISING FROM OR RELATED TO ALL UNINTENDED USES OF CYPRESS PRODUCTS. YOU SHALL INDEMNIFY AND HOLD CYCRESS HARMLESS FROM AND AGAINST ALL CLAIMS, COSTS, DAMAGES, AND OTHER LIABILITIES, INCLUDING CLAIMS FOR PERSONAL INJURY OR DEATH, ARISING FROM OR RELATED TO ANY UNINTENDED USES OF CYPRESS PRODUCTS.
