

Objective

This example demonstrates how to use PSoC® 3, PSoC 4, or PSoC 5LP to measure temperature using a thermistor.

Overview

This code example shows how to use a PSoC 3, PSoC 4, or PSoC 5LP device to measure temperature using a thermistor. Thermistors are sensors commonly used for temperature measurement. PSoC devices contain the necessary resources to accurately measure temperature using a thermistor. For more information on the theory behind thermistor temperature measurement, see [AN66477](#).

Requirements

Tool: [PSoC Creator™ 4.2](#) or newer

Programming Language: C (Arm® GCC 5.4.1, Arm MDK 5.22, DP8051 Keil 9.51)

Associated Parts: All PSoC 3, PSoC 4100, PSoC 4100 BLE, PSoC 4100 M, PSoC 4100 S, PSoC 4100 S Plus, PSoC 4200, PSoC 4200 BLE, PSoC 4200 L, PSoC 4200 M, All PSoC 5LP

Related Hardware: [CY8CKIT-025](#), [CY8CKIT-030](#), [CY8CKIT-050](#), [CY8CKIT-041-41XX](#), [CY8CKIT-042](#), [CY8CKIT-042-BLE](#), [CY8CKIT-042-BLE-A](#), [CY8CKIT-043](#), [CY8CKIT-044](#), [CY8CKIT-046](#).

Hardware Setup

For PSoC 3 and PSoC 5LP devices, follow these steps:

1. Plug CY8CKIT-025 into PORT E of either CY8CKIT-030 or CY8CKIT-050, as [Figure 1](#) shows.

Figure 1. CY8CKIT-025 Plugged in to CY8CKIT-050

2. Set J5 on CY8CKIT-025 to INT.
3. Connect an LCD to the LCD Port on CY8CKIT-030 or CY8CKIT-050.
4. (Optional) Plug an external thermistor into J7, and set J5 to EXT on CY8CKIT-025.
5. (Optional) Connect a DB9 cable from CY8CKIT-030 or CY8CKIT-050 to a PC, and connect P3[7] to TX on the P5 connector of CY8CKIT-030 or 050 to connect the UART.

Note: CY8CKIT-025 does not have to be used. An external thermistor and reference resistor can be used.

For PSoC 4 devices, follow these steps:

1. Connect a thermistor and reference resistor with the following connections to CY8CKIT-042 or a PSoC 4 kit, as [Figure 2](#) shows.

Figure 2. External Connections for PSoC 4 Kit

$$V_{hi} = P2[2], V_{therm} = P2[3], V_{low} = P2[5]$$

Note: On some PSoC 4 devices, the SAR MUX is not on Port 2, but another port such as Port 3. On those devices, change these pins to the corresponding pins on that port. Consult the device datasheet to determine the port the SAR mux is on.

2. Connect P0.5 on J4 of CY8CKIT-042 to P12.6 on J8 of CY8CKIT-042. This connects the UART.

Note: This connection is specific to the CY8CKIT-042. For other devices the SCB might be on another pin. Furthermore, other kits have dedicated connections between a PSoC 4 SCB and the KitProg, removing the need for a flywire. To determine which pins connect directly between the PSoC 4 device and the KitProg look on the underside of the kit and find the connections printed on the silkscreen, or look in the kit user guide.

Software Setup

The code example supports a terminal emulator interface. A UART interface outputs the temperature value to a terminal program on a PC.

Serial Terminal

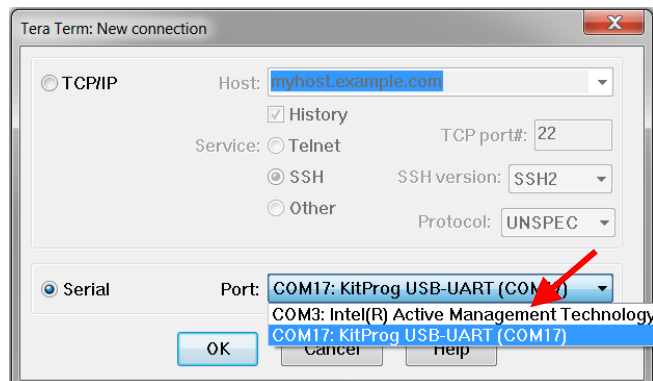

This document demonstrates using TeraTerm but any terminal emulator software may be used that is configurable to the standard UART settings shown in Figure 4. TeraTerm is open-source and downloadable directly from the author's website: <https://en.osdn.jp/projects/ttssh2/>.

1. Create new connection.

Launch TeraTerm and select **File > New connection**. Select **Serial** as the connection type and do the following:

- a. **PSoC 4 Devices:** Choose the **KitProg USB-UART** communication port (COM), as Figure 3 shows. The actual COM port number will vary between computers and USB ports. If multiple communication ports are listed, it can be helpful to disconnect and reconnect the development kit's USB cable and look for the COM port that is disappears and reappears.
- b. **PSoC 3 or PSoC 5LP Devices:** Choose the COM port where you connected the DB9 cable.

Figure 3. New Connection Creation

2. Set up serial port parameters.

Open TeraTerm Serial port setup dialog (**Setup > Serial port...**). Only the **Baud rate:** should require changing to 115200, but it is good to also confirm that the other settings are as Figure 4 shows.

Figure 4. Terminal Emulator Setup Parameters

Math Library

The Thermistor Calculator component used in this design requires the math library to be linked into the design. That step is already done for you in the attached example.

If you are creating a new Creator project and using the Thermistor Calculator component right click on your project click on **Build Settings...** expand the compiler by pressing the + button. The name of the compiler will depend on which compiler is used in the design; for Creator 4.2 it is **ARM GCC 5.4-2016-q2-update**. Click on **Linker**, in **Additional Libraries** add m, click **Apply**.

When using third party IDEs the math library will need to be added as well. The steps to do this are specific to each IDE and not described in this document. Consult help documentation for the IDE.

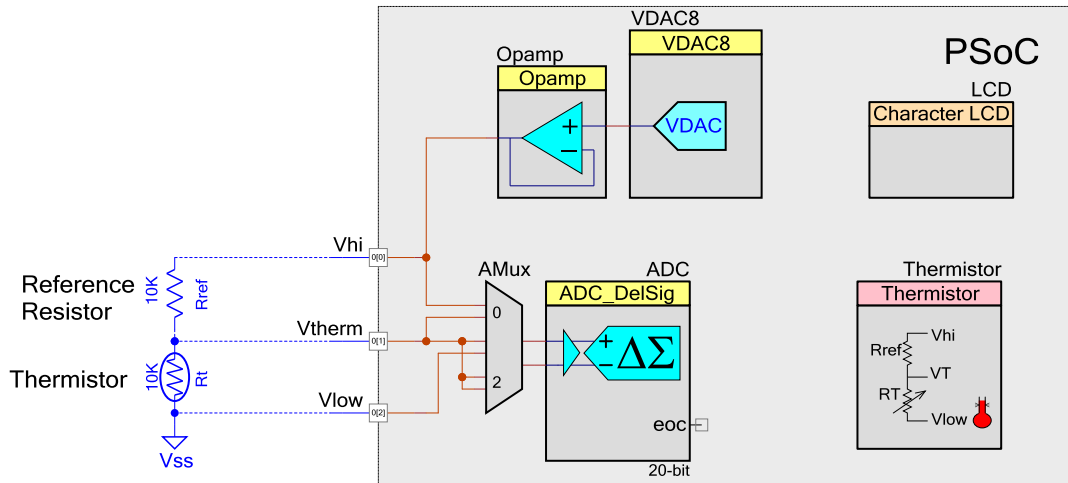

Operation

1. Load the workspace into PSoC Creator by opening `<Install_Directory>\CE210514\CE210514.cywrk`.
2. Select the project you wish to use. One project is for PSoC 4; the other is for PSoC 3 or PSoC 5LP. To select the project, right-click on it and select **set as active project**.
3. Build the example project by navigating to **Build > Build <Project Name>** in PSoC Creator.
4. Connect the kit to a PC through a USB cable. On-board KitProg devices are already connected to the programming pins of the on-board device.
5. Program the example to the device by navigating to **Debug > Program**.
6. Open the terminal program by following the instructions in the [Software Setup](#) section.
7. Power the device if not already powered.
8. Observe temperature display in the terminal program or on the display on the -030 or -050 kit LCD.

Design

AN66477 describes the theory of thermistor temperature measurement. Figure 5 shows the PSoC Creator schematic for PSoC 3 and PSoC 5LP thermistor temperature measurement.

Figure 5. Thermistor Measurement Circuit for PSoC 3 and PSoC 5LP

In this example, the voltages across the thermistor and a reference resistor are measured. Equation 1 is then used to calculate the resistance of the thermistor.

$$\text{Equation 1} \quad R_t = R_{ref} * \frac{V_{hi} - V_{therm}}{V_{therm} - V_{low}}$$

After the resistance has been determined, the Thermistor Calculator Component is used to calculate the temperature from the resistance value. The Thermistor Calculator Component uses the Steinhart-Hart equation to calculate the temperature. Equation 2 reproduces the equation. A, B, and C are the Steinhart-Hart coefficients which are calculated by the Thermistor Calculator Component.

$$\text{Equation 2} \quad \frac{1}{T_K} = A + B * \ln(R_T) + C * (\ln(R_T))^3$$

The temperature is printed out over UART or on the LCD.

Note: AMux input #2 is used for offset measurement. The inputs of the ADC are shorted together and the offset is measured, stored, and subtracted from all subsequent measurements. This technique is called correlated double sampling (CDS). For more information, consult AN66444, PSoC 3 and PSoC 5LP Correlated Double Sampling to Reduce Offset, Drift, and Low Frequency Noise.

Note: Each ADC reading is filtered via a software IIR filter. The theory behind the filter is documented in AN2099, PSoC Single-Pole Infinite Impulse Response (IIR) Filters.

Figure 6 shows the firmware flow for this project.

Figure 6: Basic Firmware Flowchart

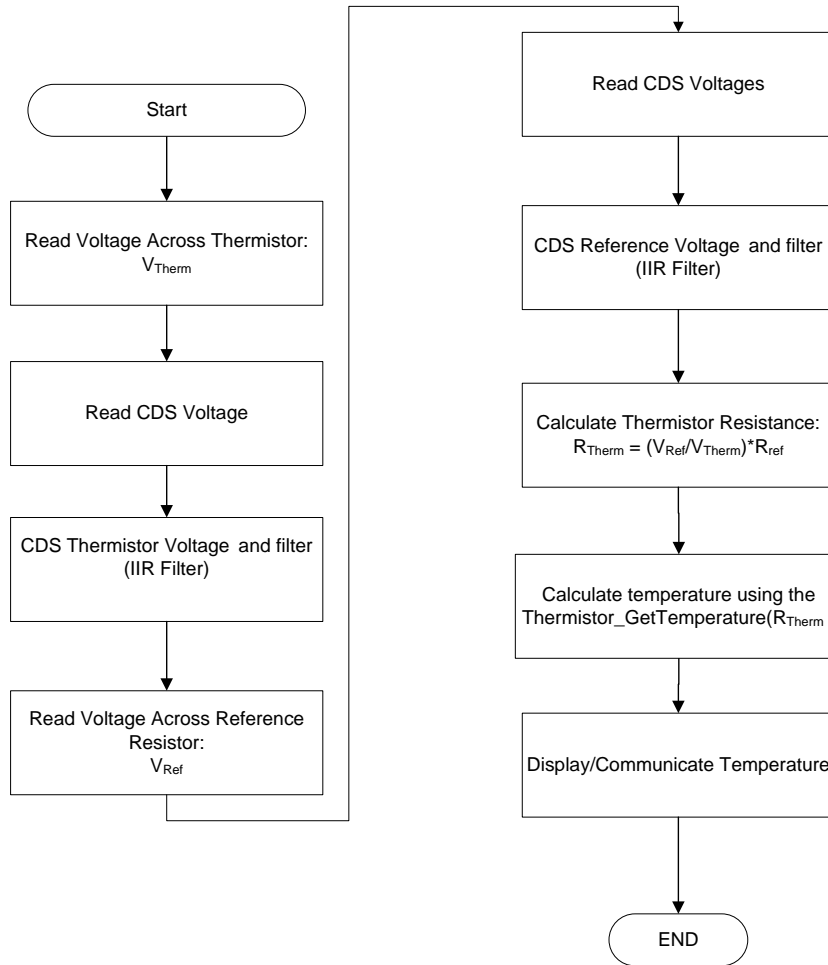

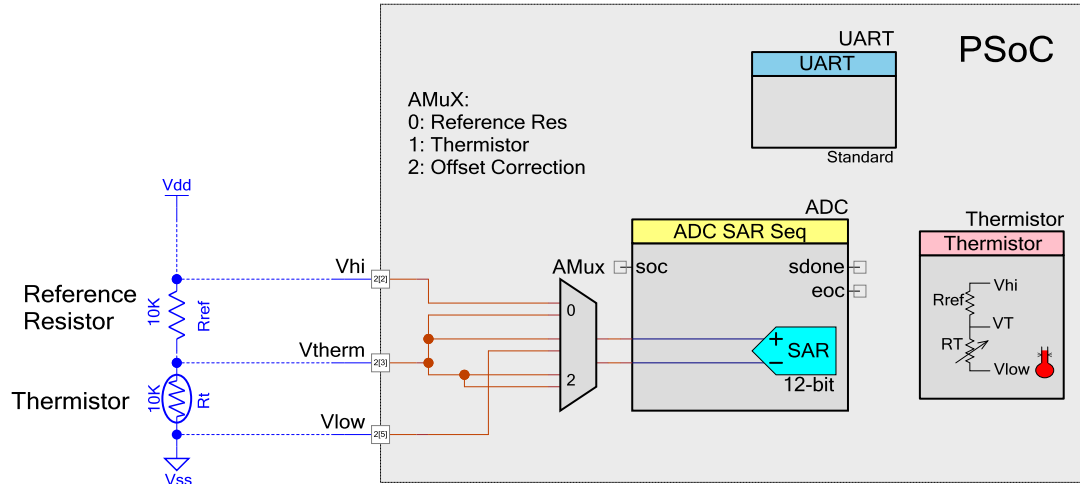

Figure 7 shows the schematic for PSoC 4 thermistor temperature measurement. The primary difference is that there is no DAC, and a SAR ADC is used.

Figure 7. Thermistor Measurement Circuit for PSoC 4

Note: The mux inside the ADC SAR Seq Component cannot be used because it does not allow two pins to be shorted together for the offset measurement. That is why an external software mux is used.

Design Considerations

With PSoC 3 and PSoC 5LP, Vhi must be connected to one of the dedicated Opamp output pins (P0[0], P0[1], P3[6], or P3[7]). If this is not done, a measurement error may be introduced; see [Appendix A – Opamp Pin Selection](#) for details.

Components

Table 1 and Table 2 list the PSoC Creator Components used in this example, as well as the hardware resources and parameter settings for each.

Table 1. List of PSoC Creator Components for PSoC 3 or PSoC 5LP

Component	Name	Hardware Resources	Non-default Parameter Settings
ADC_DeISig	ADC	1 DeISig ADC	Config1 Conversion Mode: 0 - Single Sample Resolution(bits): 20 Conversion rate (SPS): 182 Input Range: +/- 2.048 V (-Input +/- 2*Vref) Buffer Mode: Level Shift Common Number of Configurations: 1
Voltage DAC (8-bit)	VDAC	1 ViDAC	Range: 0-4.080 V (16mV / bit) Speed: Slow Speed Value: 1600 mV
Opamp	Opamp	1 Opamp	Mode: Follower
Thermistor_Calculator	Thermistor	N/A	Reference Resistor 10000 Implementation: Equation Temperature Max: 125 °C – 531 Ω Temperature Mid : 25 °C – 10000 Ω

Component	Name	Hardware Resources	Non-default Parameter Settings
			Temperature Mid : -40 °C – 195652 Ω
UART	UART	~1 UDB	Configure: Mode: TX Only Bits per second: 115200
Character LCD	LCD	7 pins	N/A

Table 2. List of PSoC Creator Components for PSoC 4

Component	Name	Hardware Resources	Non-default Parameter Settings
Sequencing SAR ADC	ADC	1 Sequencing SAR ADC	Channels A clks: 19 Sequenced Channels: 1 Channel 0: AVG checked General Channel sample rate (sps): 1900 Vref Select: VDDA Samples averaged: 16
Thermistor_Calculator	Thermistor	N/A	Reference Resistor 10000 Implementation: LUT Temperature Max: 125 °C – 531 Ω Temperature Mid : 25 °C – 10000 Ω Temperature Mid : -40 °C – 195652 Ω Calculation Error Budget: 0.1
UART	UART	1 SCB	N/A

Design-Wide Resources

Table 3 shows the physical pin usage.

Table 3. Pin Locations

Pin Name	PSoC 3/ PSoC 5LP Location	PSoC 4 Location
LCD	P2[6:0]	N/A
Vhi	P0[0]	P2[2]
Vtherm	P0[1]	P2[3]
Vlow	P0[2]	P2[5]
TX	P3[7]	P0[5]

Change Vhi, Vtherm, and Vlow to match the SAR MUX port for PSoC 4 devices where the SAR mux is not on Port 2.
