1 Introduction

Debugging on the target board is a very important step in project design. This document will describe how to debug on a target board.

The debugging interface described in this document can be used both as the in-circuit debugging tool and the in-circuit programming tool.

2 Application Environment

This chapter introduces application environment for MB95200H/210H SOP20 PGM adaptor.

2.1 Debug Tool

The debugging tool is BGMA (BGM Adaptor) and its model No. is MB2146-08-E, as shown in the picture below. It is available in the MB95200 MCU Starter Kit (PN: MB2146-410A-01-E).

Figure 1. BGM Adaptor

2.2 SOFTUNE

SOFTUNE is used as software development environment for programming and debugging.

The version currently being used is F²MC-8L/8FX SOFTUNE Workbench V30L31, as shown below in the picture. It is available in the MB95200 MCU Starter Kit (PN: MB2146-410-01-E)

Figure 2. SOFTUNE Version

3 MCU Products

This chapter introduces different models of MCU products.

As the in-circuit debugging interface in the single flash MCU is different from that in the dual flash MCU, MCUs are classified into two categories in the list below.

Table 1. MCU Products

Series	Flash type	Chip list	Series	Flash type	Chip list
MB95F200H	Single Flash	MB95F202K	MB95F260H	Dual Flash	MB95F262K
		MB95F202H			MB95F262H
		MB95F203K			MB95F263K
		MB95F203H			MB95F263H
		MB95F204K			MB95F264K
		MB95F204H			MB95F264H
MB95F210H	Single Flash	MB95F212K	MB95F270H	Dual Flash	MB95F272K
		MB95F212H			MB95F272H
		MB95F213K			MB95F273K
		MB95F213H			MB95F273H
		MB95F214K			MB95F274K
		MB95F214H			MB95F274H
MB95F220H	Single Flash	MB95F222K	MB95F280H	Dual Flash	MB95F282K
		MB95F222H			MB95F282H
		MB95F223K			MB95F283K
		MB95F223H			MB95F283H
					MB95F284K
					MB95F284H
			MB95F330H	Dual Flash	MB95F332K
					MB95F332H
					MB95F333K
					MB95F333H
					MB95F334K
					MB95F334H

4 Hardware Design

This chapter introduces the circuit of debugging interface.

As the MB95200 series has two types of flash, i.e. single flash and dual flash, there are two types of debugging circuits corresponding to them. This chapter will introduce the two programming circuits. Make sure to choose the correct circuit in application.

4.1 Single Flash MCU Debugging Circuit

Figure 3 shows the circuit diagram of the in-system debugging interface. To design the in-system debugging interface, four pins, UVCC_EV, GND, RSTIN and DBG, are needed. (Add pin RST_OUT if necessary).

Figure 3. Basic Connector Circuit for Single Flash MCU

Component Recommendation:

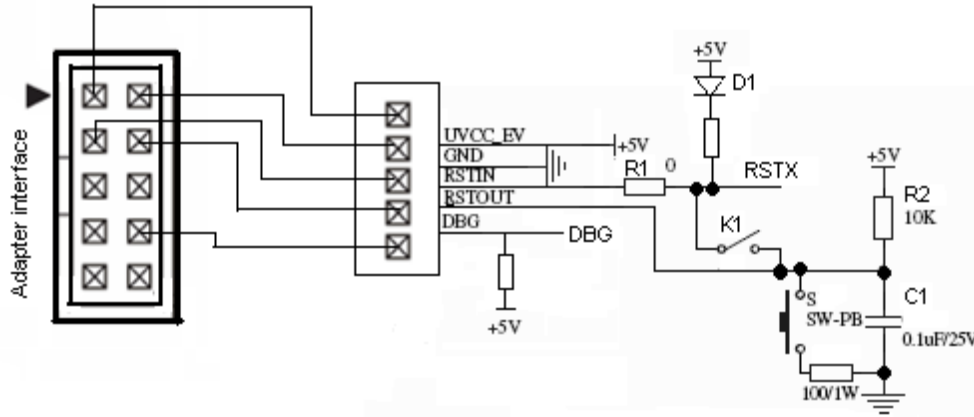

D1: $V_F < 0.3V$ when $I_F = 1mA$. E.g. LL103A, 1SS294

Below is a list of functions of the interface connector.

1. J1 is a 10-pin connector, used as the circuit interface.
2. The write voltage ($V_{CC} = 4.5V$ to $5.5V$) is supplied from the user system. The UVCC_EV and DBG pins control the PGM mode entry.
3. Pin 2 of the connector connects to the GND.
4. The debugger provides 10 V directly to the RSTX pin during flash erase/write operation. If it is pulled high in the user system, please consider to add a low-drop diode for separate H voltage.
5. The DBG pin provides 1-line UART communication with the debugger. Serial write mode can be set by providing special timing of DBG and VCC pins.

If the MCU target needs a reset circuit, please design the reset circuit according to the diagram below.

Figure 4. Debugging Connector and Reset Circuit for Single Flash MCU

Pin 4 of the connector is used to connect to the reset circuit. Please design a switch K1 between the reset circuit and the reset pin (RSTX). Make sure to cut off K1 to stop the high voltage flowing through the reset circuit during the debugging operation. Turn on K1 to supply the reset circuit to the target MCU when the debugging operation is over.

4.2 Dual Flash MCU Debugging Circuit

Figure 5 shows the circuit diagram of the in-system debugging interface. To design the in-system debugging interface, three pins, UVCC_EV, GND and DBG, are needed. (Add pin RST_OUT if necessary.)

Figure 5. Dual Flash MCU Debugging Circuit

Component Recommendation:

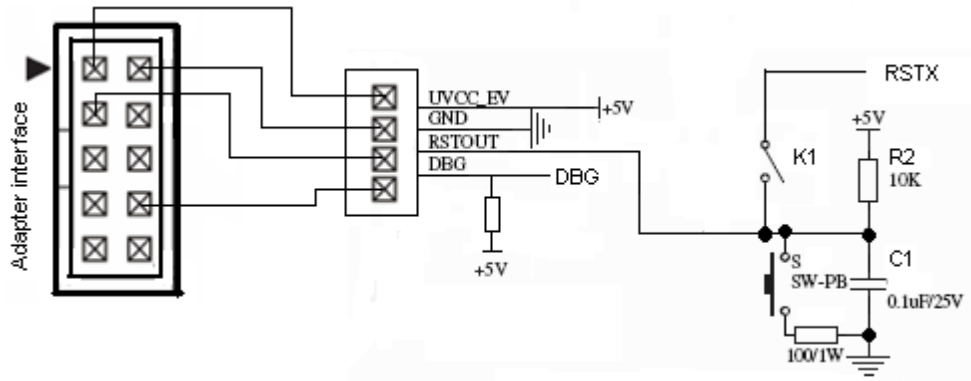

D1: $V_F < 0.3V$ when $I_F = 1mA$. E.g. LL103A, 1SS294

Below is a list of functions of the interface connector.

1. J1 is a 10-pin connector, used as the interface of this circuit.
2. The write voltage ($V_{CC} = 4.5V$ to $5.5V$) is supplied from the user system. The UVCC_EV and DBG pins control the PGM mode entry.
3. Pin 2 of the connector connects to the GND.
4. The DBG pin provides 1-line UART communication with the debugger. Serial write mode can be set by providing special timing of DBG and VCC pins.

If the MCU target need a reset circuit, and please design a reset circuit as follow circuit.

Figure 6. In-system Debugger Interface

Pin 4 of the connector is used to connect to the reset circuit. Design a switch K1 between the reset circuit and the reset pin (RSTX). When debugging operation is over, K1 can be switched on to supply the reset circuit to the target MCU.

5 Debugging Operation

This chapter introduces debugging operation by F²MC-8L/8FX SOFTUNE.

5.1 Preparation before using F²MC-8L/8FX SOFTUNE

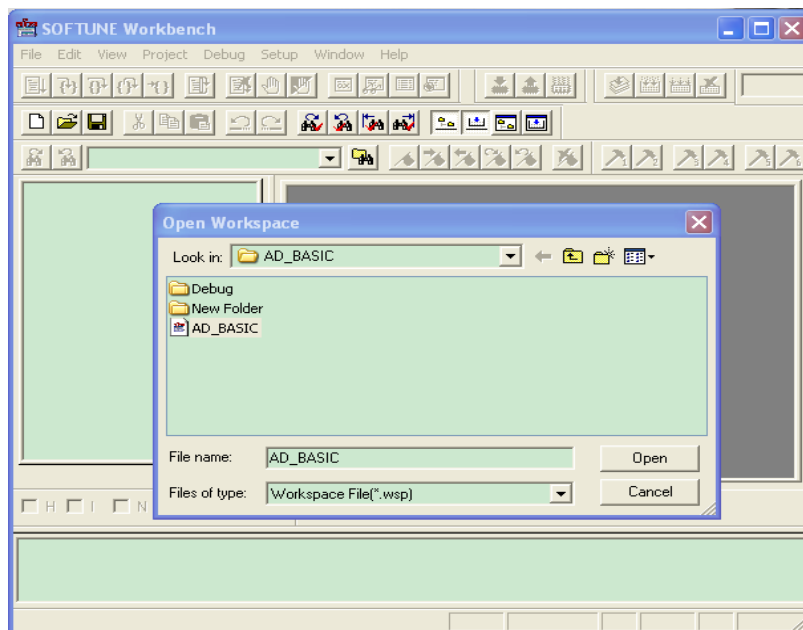

1. Connect the BGMA to a PC.
2. Connect the EV-board to the BGMA (Note that user can only power on the MCU after connecting the target board to the BGM adaptor).
3. Power on the EV-board.

Figure 7. Step 1-3

4. Open a project (E.g. IO_LED) using SOFTUNE.

Figure 8. Open the Demo Project

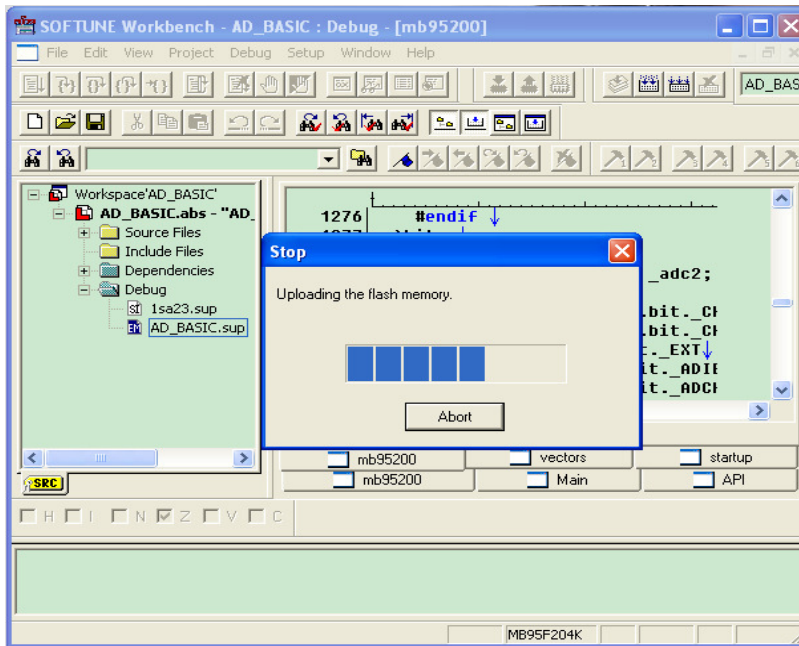

5.2 Debugging with F²MC-8L/8FX SOFTUNE

After the 3-step preparation introduced in Chapter 5.1, user can start debugging as shown below.

1. Start debugging. (by clicking **Start Debug** in **Debug**)

Figure 9. Start Debugging

2. Start Debugging (Code Update)

Select **Debug** -> **Run** to start debugging or use the shortcut key as indicated in Figure 11.

Figure 10. Run Operation

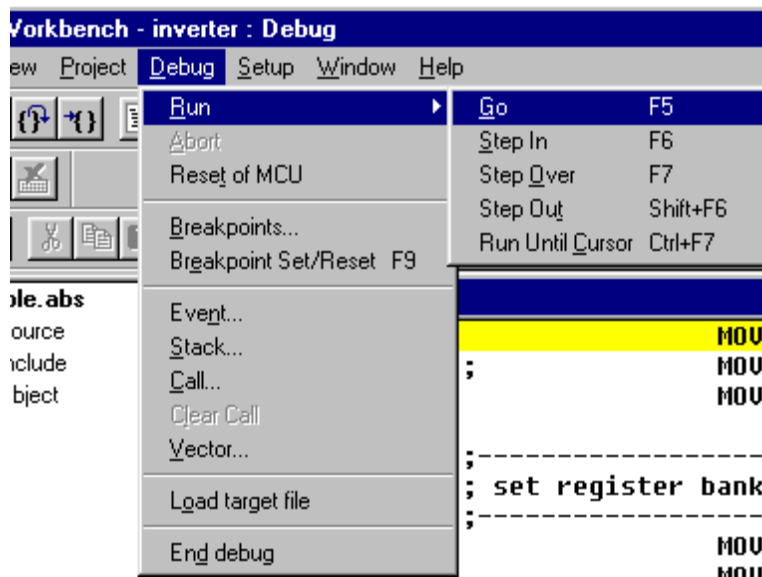

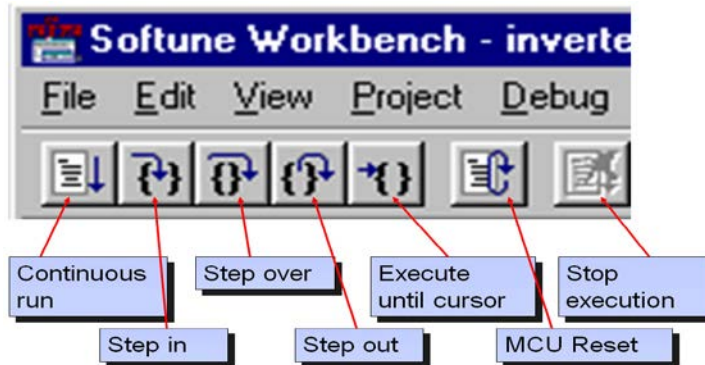

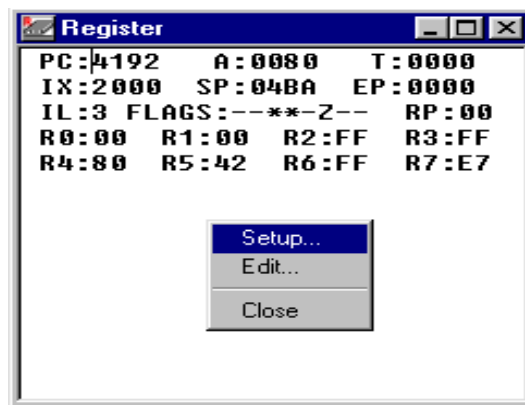

Figure 11. Shortcut Keys

3. Register Operation

Select **View -> Register** to open the **Register** window. Then right click, select **Setup** from shortcut menu to add/delete registers in the register window. Select **Edit -> Register** from the pull-down list, input the value in **Register value**, and Click **OK** to store the new value to the register.

Figure 12. Register Operation

4. Memory Operation

Then select **View -> Memory** to display the Memory window, Address content can be modified by highlight the address and then type the new value.

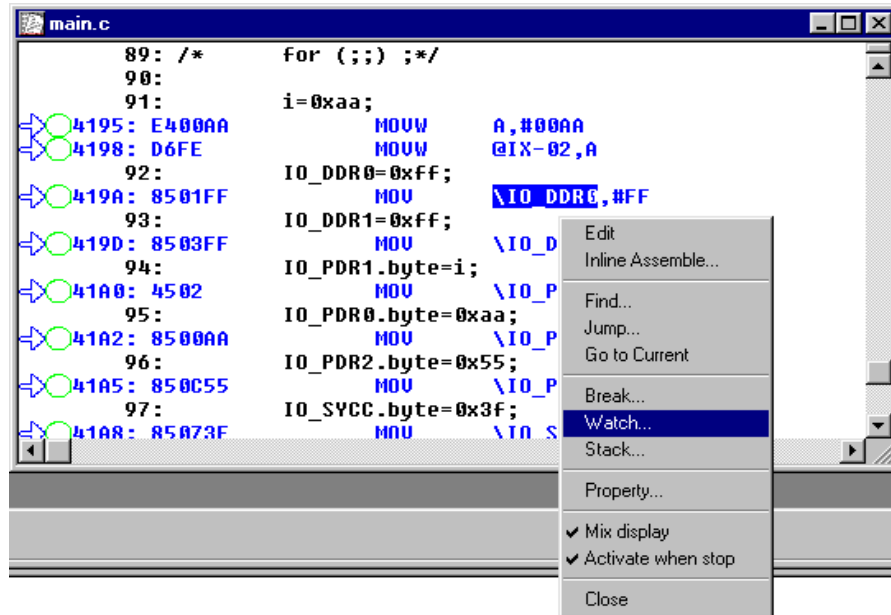

Figure 13. Memory Operation

5. Watch Operation

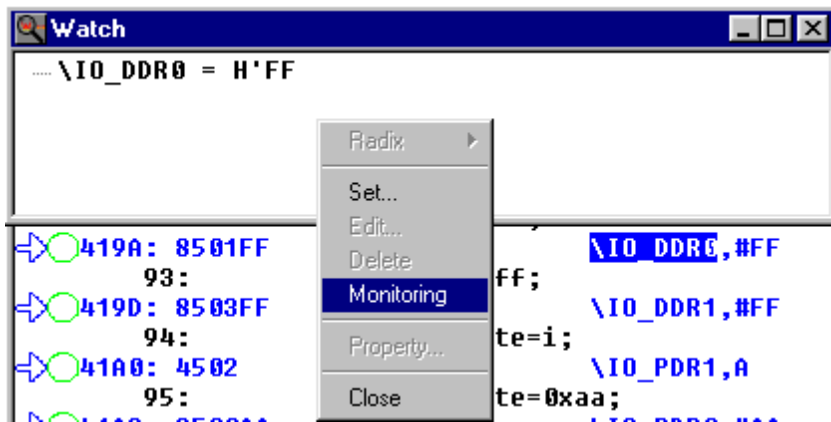

Highlight the symbol to be watched. Right click and select **Watch** in the shortcut menu.

Figure 14. Select the Watch Window

Put the mouse pointer inside the window. Right click and select **Monitoring** from shortcut menu to monitor symbols continuously.

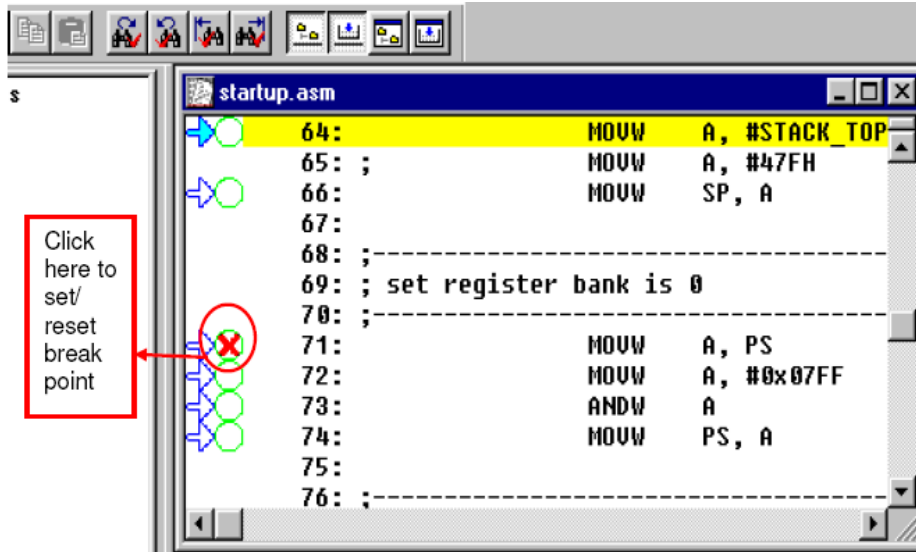

Figure 15. Continuously Monitoring

6. Breakpoints Setting

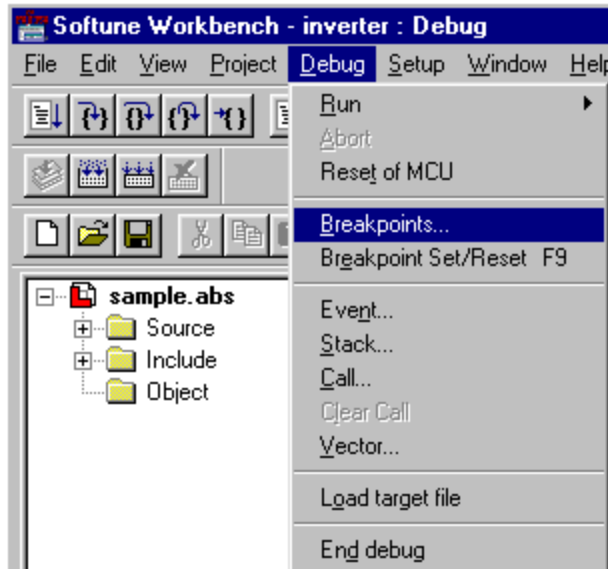

Set breakpoints by clicking the green circle in the code, as shown in the figure below.

Figure 16. Breakpoints Setting Method 1

Another way to set breakpoints is specifying the program address or data address by selecting Debug -> Breakpoints.

Figure 17. Breakpoints Setting Method 2
