

## Objective

This example project is based on a PSoC® Creator™ starter design for the PSoC 4 device. It demonstrates how an F-RAM device can be used with a PSoC device to read and write data. In this project, the PSoC device scans through the F-RAM address space writing the address and then reading it back.

## Development Kit Configuration

This example project is designed to run on the CY8CKIT-042-BLE kit from Cypress Semiconductor. A description of the kit, along with more example programs and ordering information, can be found at <http://www.cypress.com/documentation/development-kitsboards/cy8ckit-042-ble-bluetooth-low-energy-ble-pioneer-kit>.

The project requires configuration settings changes to run on other kits from Cypress Semiconductor. [Table 1](#) lists supported kits. To use any other kit, change the project's device with the help of Device Selector called from the project's context menu.

Table 1. Development Kits and Parts

Development Kit	Device
CY8CKIT-042-BLE	CY8C4247LQI-BL483
CY8CKIT-044	CY8C4247AZI-M485
CY8CKIT-046	CY8C4248BZI-L489

Pin assignments for the supported kits are in [Table 2](#).

Table 2. Pin Assignments for Supported Kits

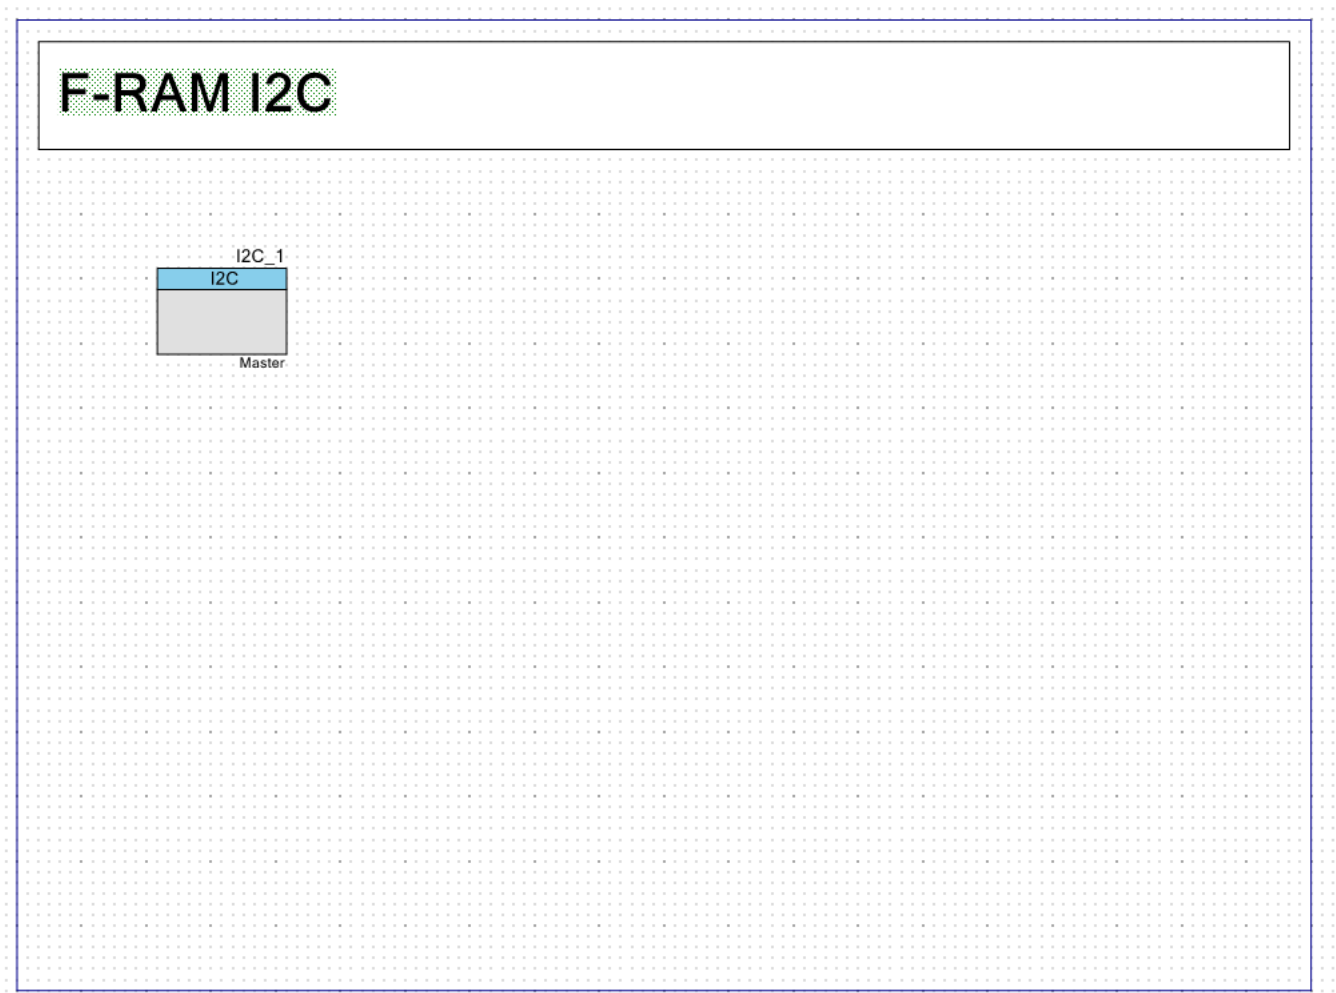

Pin Name	Development Kit			
	CY8CKIT-042	CY8CKIT-042 BLE	CY8CKIT-044	CY8CKIT-046
\I2C_1:sc\	P5[1]	P5[1]	P5[1]	P5[1]
\I2C_1:sda\	P5[0]	P5[0]	P5[0]	P5[0]

Set jumper J9 (J16 for CY8CKIT-042-BLE) to 3.3V position.

## Project Configuration

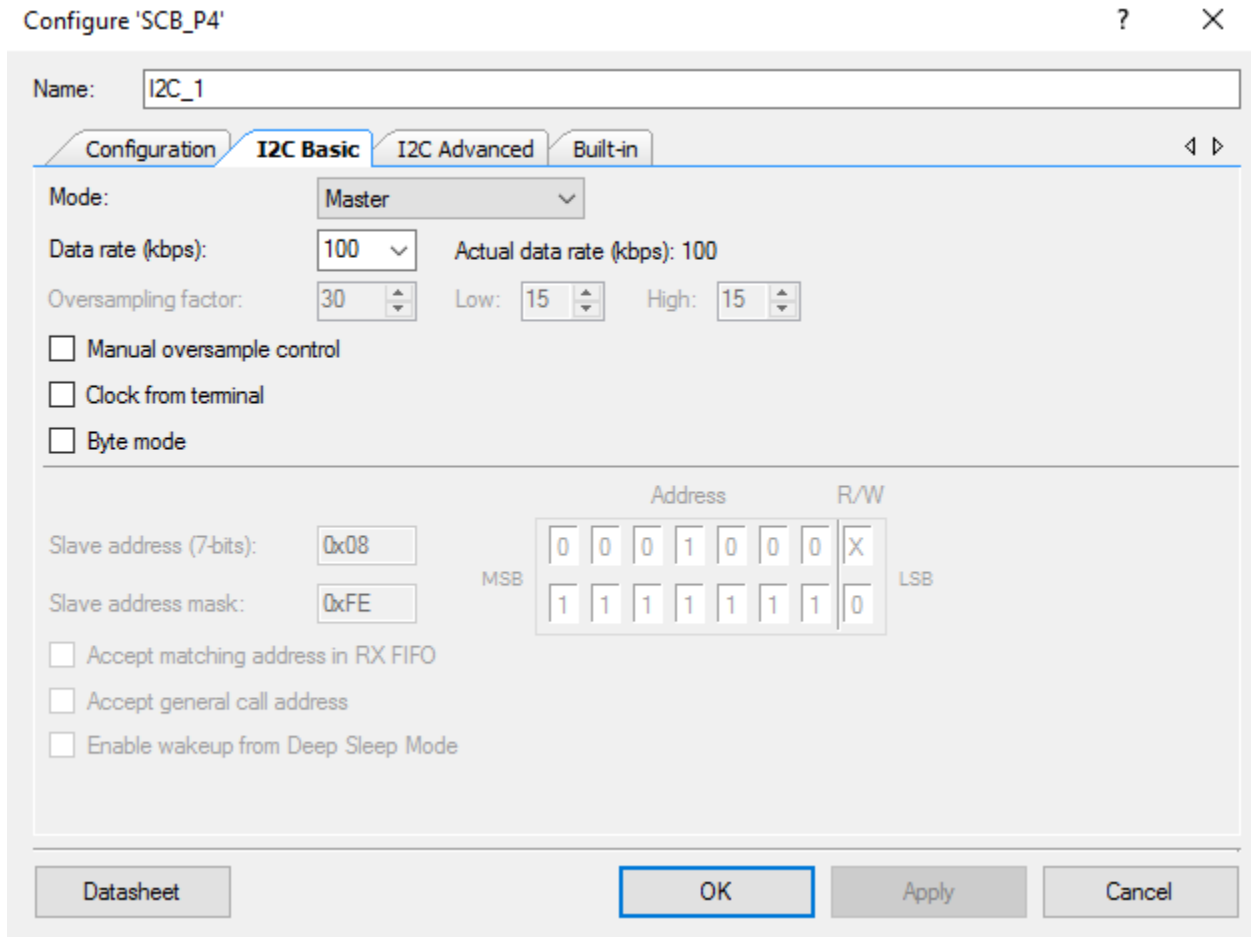

This example project consists of an I<sup>2</sup>C master and a slave F-RAM device. The top design schematic is shown in [Figure 1](#).

Figure 1. Top Design Schematic

The I<sup>2</sup>C master is used to move data to and from the F-RAM device. The I<sup>2</sup>C Component configuration is shown in Figure 2.

Figure 2. I<sup>2</sup>C Component Configuration Window

## Project Description

In the main function, the I<sup>2</sup>C master is started. The “for” loop in *main.c* loops the address space of the F-RAM and writes the address value. . Please refer to the project files included with this project.

## Expected Results

There is no output from the PSoC device. This project is designed to be a starting template to show how the F-RAM device is accessed via the PSoC device.

## Schematic

Figure 3. Connection Schematic

## Using I<sup>2</sup>C to Communicate with the F-RAM Device

This example project communicates with the F-RAM device using I<sup>2</sup>C. I<sup>2</sup>C is a simple Clock/Data bus using 8-bit serial words. Code 1 and Code 2 perform the Write and Read operations for the I<sup>2</sup>C master to access the F-RAM device.

### Code 1. I<sup>2</sup>C F-RAM Write

```

/*****
* Function Name: FRAM_Write
*****
*
* Summary:
*   F-RAM Byte Write Command
*   uint16 address - address in the F-RAM array
*   uint8 data - data to be written
*
*****/
void FRAM_Write(uint16 address, uint8 data)
{
    uint8 txBuffer[BUFFER_SIZE];

    txBuffer[0] = address >> 8;
    txBuffer[1] = address;
    txBuffer[2] = data;

    /* Clear any previous status */
    I2C_1_I2CMasterClearStatus();

    /* I2C Write Command */
    status = I2C_1_I2CMasterWriteBuf(SLAVE_ADDRESS, (uint8 *) txBuffer, BUFFER_SIZE,
    I2C_1_I2C_MODE_COMPLETE_XFER);

    for(;;)
    {
        if(0u != (I2C_1_I2CMasterStatus() & I2C_1_I2C_MSTAT_WR_CMPLT))
        {
            /* Transfer complete. Check Master status to make sure that transfer
            completed without errors. */
            break;
        }
    }
}

```

```

    }
  }
}

```

## Code 2. I<sup>2</sup>C F-RAM Read

```

/*****
 * Function Name: FRAM_Read
 *****/
 *
 * Summary:
 * F-RAM Byte Read Command
 * uint16 address - address in the F-RAM array
 * uint8 retron - data to be read
 *
 *****/
uint8 FRAM_Read(uint16 address)
{
    uint8 rxBuffer[BUFFER_SIZE-2];
    uint8 txBuffer[2];

    txBuffer[0] = address >> 8;
    txBuffer[1] = address;

    /* Clear any previous status */
    I2C_1_I2CMasterClearStatus();

    /* I2C Write Command to Set the Address*/
    status = I2C_1_I2CMasterWriteBuf(SLAVE_ADDRESS, (uint8 *) txBuffer, 0x2,
I2C_1_I2C_MODE_COMPLETE_XFER);
    for(;;)
    {
        if(0u != (I2C_1_I2CMasterStatus() & I2C_1_I2C_MSTAT_WR_CMPLT))
        {
            /* Transfer complete. Check Master status to make sure that transfer
            completed without errors. */
            break;
        }
    }

    /* Clear any previous status */
    I2C_1_I2CMasterClearStatus();

    /* I2C Read Command */
    status = I2C_1_I2CMasterReadBuf(SLAVE_ADDRESS, (uint8 *) rxBuffer, 1, I2C_1_I2C_MODE_COMPLETE_XFER);
    for(;;)
    {
        if(0u != (I2C_1_I2CMasterStatus() & I2C_1_I2C_MSTAT_RD_CMPLT))
        {
            /* Transfer complete. Check Master status to make sure that transfer
            completed without errors. */
            break;
        }
    }
    return rxBuffer[0];
}

```
