

Base Timer Channel (BT)

1.0

BT_1

Unconfigured

Features

- Four operating modes
 - 16-bit PWM Timer
 - 16-bit PPG Timer
 - 16/32-bit Reload Timer
 - 16/32-bit PWC Timer
- Trigger generation for ADC conversion

General Description

The Peripheral Driver Library (PDL) Base Timer (PDL_BT) component allows configuring a single channel of the BT peripheral block. The BT is a multifunction peripheral block with the following operational modes: PWM, PPG, PWC, RT. Each mode is available as a pre-configured schematic in the PSoC Creator Component Catalog.

There is also unconfigured BT component entry in the Component Catalog.

This component uses firmware drivers from the PDL_BT module, which is automatically added to your project after a successful build.

When to Use a PDL_BT Component

The default use of the PDL_BT component is to generate a periodic event or interrupt signal. However, there are other potential uses, such as creating clock dividers or measuring the length of time between hardware events.

- A Counter mode is better used in situations focused on counting events.
- A PWM mode is better used in situations requiring compare outputs.

- A Timer is typically used to record the number of clock cycles between events. An example of this is measuring the number of clocks between two rising edges as might be generated by a tachometer sensor.
- The PPG is used for arbitrary waveform generation.

Quick Start

Follow the quick start steps below to configure and initialize the BT peripheral block.

1. Drag a PDL_BT component from the Component Catalog FMx/Digital/ folder onto your schematic. The placed instance takes the name BT_1.
2. Double-click to open the component's Configure dialog.
3. On the **Basic** tab set the needed configuration.
4. On the **Interrupts** tab, initialize needed interrupts and their callback functions.
5. Depending on the selected component configuration, there will be added tab(s) with specific parameters.
6. Assign pins in your device using the Pin Editor. If you are creating a design for a development kit, refer the kit User Guide for suitable pin assignments.
7. Build the project to verify the correctness of your design. This will add the required PDL modules to the Workspace Explorer and generate configuration data for the BT_1 instance.
8. In the *main.c* file, initialize the peripheral and start the application. The example assumes the BT configured in PWM mode.

```
BT_1_SetPinFunc_TIOA_OUT();  
Bt_Pwm_Init(&BT_1_HW, &BT_1_Config);  
Bt_Pwm_WriteCycleVal(&BT_1_HW, val0);/* Set cycle value */  
Bt_Pwm_WriteDutyVal(&BT_1_HW, val1);/* Set duty cycle value*/  
Bt_Pwm_EnableCount(&BT_1_HW);
```

9. Build and program the device.

Component Parameters

The PDL_BT component Configure dialog allows you to edit the configuration parameters for the component instance.

Basic Tab

This tab contains the component parameters used in the basic peripheral initialization settings.

| Parameter Name | Description |
|----------------|--|
| BTConfig | Selects the timer operating mode to one of the following modes: <ul style="list-style-type: none"> ▪ PWM - configured to be in PWM mode. ▪ PPG - configured to be in PPG mode. ▪ PWC - configured to be in PWC mode. ▪ RT - configured to be in RT mode. ▪ Unconfigured - This is the default mode. The BT component must be configured at run-time when configured in this mode. |
| ConnectTIOA | Connect the TIOA signal to a pin. |
| ConnectTIOB | Connect the TIOB signal to a pin. |

Interrupts Tab

This tab contains the Interrupts configuration settings.

| Parameter Name | Description |
|----------------------------|--|
| bTouchNvic | Update the NVIC with the BT interrupts. |
| bPpgTrigIrq | Assert an interrupt on a trigger event. Visible when PPG mode selected. |
| bPpgUnderflowIrq | Assert an interrupt on a timer underflow. Visible when PPG mode selected. |
| pfnPpgTrigIrqCb | Trigger event interrupt callback. Note: this generates a declaration only - USER must implement the function. Visible when PPG mode selected. |
| pfnPpgUnderflowIrqCb | Timer underflow event interrupt callback. Note: this generates a declaration only - USER must implement the function. Visible when PPG mode selected. |
| bPwcMeasureOverflowIrq | Assert an interrupt on a measurement overflow. Visible when PWC mode selected. |
| pfnPwcMeasureOverflowIrqCb | Measurement overflow event interrupt callback. Note: this generates a declaration only - USER must implement the function. Visible when PWC mode selected. |
| bPwcMeasureCompleteIrq | Assert an interrupt on a measurement event. Visible when PWC mode selected. |
| pfnPwcMeasureCompleteIrqCb | Measurement complete interrupt callback. Note: this generates a declaration only - USER must implement the function. Visible when PWC mode selected. |

| Parameter Name | Description |
|----------------------|---|
| bPwmDutyMatchIrq | Assert an interrupt when timer matches the duty cycle. Visible when PWM mode selected. |
| pfnPwmDutyMatchIrqCb | Duty match event interrupt callback. Note: this generates a declaration only - USER must implement the function. Visible when PWM mode selected. |
| bPwmTrigIrq | Assert an interrupt on a trigger event. Visible when PWM mode selected. |
| pfnPwmTrigIrqCb | Trigger event interrupt callback. Note: this generates a declaration only - USER must implement the function. Visible when PWM mode selected. |
| bPwmUnderflowIrq | Assert an interrupt on a timer underflow. Visible when PWM mode selected. |
| pfnPwmUnderflowIrqCb | Timer underflow event interrupt callback. Note: this generates a declaration only - USER must implement the function. Visible when PWM mode selected. |
| bRtTrigIrq | Assert an interrupt on a trigger event. Visible when RT mode selected. |
| pfnRtTrigIrqCb | Trigger event interrupt callback. Note: this generates a declaration only - USER must implement the function. Visible when RT mode selected. |
| bRtUnderflowIrq | Assert an interrupt on a timer underflow. Visible when RT mode selected. |
| pfnRtUnderflowIrqCb | Timer underflow event interrupt callback. Note: this generates a declaration only - USER must implement the function. Visible when RT mode selected. |

PPG Tab

This tab contains the PPG configuration settings. Visible when PPG mode selected.

| Parameter Name | Description |
|---------------------|--|
| enPpgExtTrig | Select an external trigger and choose the triggering edge. |
| enPpgMode | PPG mode. |
| enPpgOutputMask | PPG output mask. |
| enPpgOutputPolarity | Initial state of PPG output. |
| enPpgPres | Apply a divider to the internal clock or use an external source. |
| enPpgRestartEn | PPG restart option. |

PWC Tab

This tab contains the PWC configuration settings. Visible when PWC mode selected.

| Parameter Name | Description |
|------------------|--|
| enPwcMeasureEdge | Select the edges to start and stop the measurements. |
| enPwcMode | PWC mode. |

| Parameter Name | Description |
|----------------|--|
| enPwcPres | Apply a divider to the internal clock or use an external source. |
| enPwcSize | PWC counter size. |

PWM Tab

This tab contains the PWM configuration settings. Visible when PWM mode selected.

| Parameter Name | Description |
|---------------------|--|
| enPwmExtTrig | Select an external trigger and choose the triggering edge. |
| enPwmMode | PWM mode. |
| enPwmOutputMask | PWM output mask. |
| enPwmOutputPolarity | Initial state of PWM output. |
| enPwmPres | Apply a divider to the internal clock or use an external source. |
| enPwmRestartEn | PWM restart option. |

RT Tab

This tab contains the RT configuration settings. Visible when RT mode selected.

| Parameter Name | Description |
|--------------------|--|
| enRtExtTrig | Select an external trigger and choose the triggering edge/level. |
| enRtMode | Reload Timer mode. |
| enRtOutputPolarity | Initial state of Reload Timer output. |
| enRtPres | Apply a divider to the internal clock or use an external source. |
| enRtSize | RT counter size. |

Component Usage

After a successful build, firmware drivers from the PDL_BT module are added to your project in the pdl/drivers/bt folder. Pass the generated data structures to the associated PDL functions in your application initialization code to configure the peripheral.

Generated Data

The PDL_BT component populates the following peripheral initialization data structure(s). The generated code is placed in C source and header files that are named after the instance of the component (e.g. *BT_1_config.c*). Each variable is also prefixed with the instance name of the component.

| Data Structure Type | Name | Description |
|---------------------|-------------|--|
| stc_pwm_irq_en_t | BT_1_IrqEn | Interrupt enable structure. Generated when PWM mode selected. |
| stc_ppg_irq_en_t | BT_1_IrqEn | Interrupt enable structure. Generated when PPG mode selected. |
| stc_pwc_irq_en_t | BT_1_IrqEn | Interrupt enable structure. Generated when PWC mode selected. |
| stc_rt_irq_en_t | BT_1_IrqEn | Interrupt enable structure. Generated when RT mode selected. |
| stc_pwm_irq_cb_t | BT_1_IrqCb | Interrupt callback function. Generated when PWM mode selected. |
| stc_ppg_irq_cb_t | BT_1_IrqCb | Interrupt callback function. Generated when PPG mode selected. |
| stc_pwc_irq_cb_t | BT_1_IrqCb | Interrupt callback function. Generated when PWC mode selected. |
| stc_rt_irq_cb_t | BT_1_IrqCb | Interrupt callback function. Generated when RT mode selected. |
| stc_bt_pwm_config_t | BT_1_Config | Configuration structure. Generated when PWM mode selected. |
| stc_bt_ppg_config_t | BT_1_Config | Configuration structure. Generated when PPG mode selected. |
| stc_bt_pwc_config_t | BT_1_Config | Configuration structure. Generated when PWC mode selected. |
| stc_bt_rt_config_t | BT_1_Config | Configuration structure. Generated when RT mode selected. |

Once the component is initialized, the application code should use the peripheral functions provided in the referenced PDL files. Refer to the PDL documentation for the list of provided API functions. To access this document, right-click on the component symbol on the schematic and choose “**Open API Documentation...**” option in the drop-down menu.

Preprocessor Macros

The BT component generates the following preprocessor macro(s). Note that each macro is prefixed with the instance name of the component (e.g. “BT_1”).

| Macro | Description |
|---------|--|
| BT_1_HW | Hardware pointer to the block instance in the device. This should be used in all API calls to specify the block to access. |

| Macro | Description |
|------------------------|--|
| BT_1_SetPinFunc_TIOA() | Macro to assign BT TIOA signal in the device pin. This macro will be generated if the parameter ConnectTIOA was set to <i>true</i> . |
| BT_1_SetPinFunc_TIOB() | Macro to assign BT TIOB signal in the device pin. This macro will be generated if the parameter ConnectTIOB was set to <i>true</i> . |
| BT_1_BT_CONFIG | BT operational mode. Is set to one of the following values based on the BTConfig parameter option: BT_1_BT_UNCONFIGURED , BT_1_BT_PWM, BT_1_BT_PPG, BT_1_BT_RT or BT_1_BT_PWC. |

Data in RAM

The generated data may be placed in flash memory (const) or RAM. The former is the more memory-efficient choice if you do not wish to modify the configuration data at run-time. Under the **Built-In** tab of the Configure dialog, set the parameter CONST_CONFIG to make your selection. The default option is to place the data in flash.

Interrupt Support

If the PDL_BT component is specified to trigger interrupts, it will generate the callback function declaration that will be called from the BT ISR. The user is then required to provide the actual callback code. If a null string is provided the struct is populated with zeroes and the callback declaration is not generated. In that case it is the user’s responsibility to modify the struct in firmware.

The component generates the following function declarations.

| Function Callback | Description |
|------------------------|--|
| BT_1_PwmTrigIrqCb | Trigger interrupt callback function. Note: this generates a declaration only - USER must implement the function. This declaration is generated only when PWM mode selected. |
| BT_1_PwmDutyMatchIrqCb | Duty match interrupt callback function. Note: this generates a declaration only - USER must implement the function. This declaration is generated only when PWM mode selected. |
| BT_1_PwmUnderflowIrqCb | Underflow interrupt callback function. Note: this generates a declaration only - USER must implement the function. This declaration is generated only when PWM mode selected. |
| BT_1_PpgTrigIrqCb | Trigger interrupt callback function. Note: this generates a declaration only - USER must implement the function. This declaration is generated only when PPG mode selected. |
| BT_1_PpgUnderflowIrqCb | Duty match interrupt callback function. Note: this generates a declaration only - USER must implement the function. This declaration is generated only when PPG mode selected. |

| Function Callback | Description |
|------------------------------|--|
| BT_1_PwcMeasureCompleteIrqCb | Measure completion interrupt callback function. Note: this generates a declaration only - USER must implement the function. This declaration is generated only when PWC mode selected. |
| BT_1_PwcMeasureOverflowIrqCb | Measure overflow interrupt callback function. Note: this generates a declaration only - USER must implement the function. This declaration is generated only when PWC mode selected. |
| BT_1_RtTrigIrqCb | Trigger interrupt callback function. Note: this generates a declaration only - USER must implement the function. This declaration is generated only when RT mode selected. |
| BT_1_RtUnderflowIrqCb | Duty match interrupt callback function. Note: this generates a declaration only - USER must implement the function. This declaration is generated only when RT mode selected. |

Code Examples and Application Notes

There are numerous code examples that include schematics and example code available online at the [Cypress Code Examples web page](#).

Cypress also provides a number of application notes describing how FMx devices can be integrated into your design. You can access the Cypress Application Notes search web page at www.cypress.com/appnotes.

Resources

The PDL_BT component uses one channel of Base Timer (BT) peripheral block.
