

**Please note that Cypress is an Infineon Technologies Company.**

The document following this cover page is marked as “Cypress” document as this is the company that originally developed the product. Please note that Infineon will continue to offer the product to new and existing customers as part of the Infineon product portfolio.

**Continuity of document content**

The fact that Infineon offers the following product as part of the Infineon product portfolio does not lead to any changes to this document. Future revisions will occur when appropriate, and any changes will be set out on the document history page.

**Continuity of ordering part numbers**

Infineon continues to support existing part numbers. Please continue to use the ordering part numbers listed in the datasheet for ordering.

## Objective

This example demonstrates how to configure a GPIO to generate an interrupt in PSoC® 6 MCU using PSoC Creator™.

## Requirements

**Tool:** PSoC Creator™ 4.2; Peripheral Driver Library (PDL) 3.0.4

**Programming Language:** C (Arm® GCC 5.4.1 and Arm MDK 5.22)

**Associated Parts:** All PSoC 6 MCU parts

**Related Hardware:** PSoC 6 BLE Pioneer Kit, PSoC 6 WiFi-BT Pioneer Kit

## Overview

This code example demonstrates the use of GPIO configured as an input pin to generate interrupts on the CM4 CPU in PSoC 6 MCU. The GPIO signal interrupts the CPU and executes a user-defined Interrupt Service Routine (ISR). The GPIO interrupt acts as a wakeup source to wake the CPU from Deep Sleep.

## Hardware Setup

This example uses the kit's default configuration. Refer to the kit guide to ensure the kit is configured correctly.

## Software Setup

None.

## Operation

1. Plug the kit into your computer's USB port.
2. Build the project and program it into the PSoC 6 MCU device. Choose **Debug > Program**. For more information on device programming, see PSoC Creator Help. Flash for both CPUs is programmed in a single program operation.
3. Confirm that the LED blinks four times and then turns OFF, indicating that the CPU has entered Deep Sleep.
4. Press the user switch connected to P0[4] to trigger an interrupt. This should cause the device to wake up, causing the LED to resume blinking at a new interval (faster blink rate to indicate that the ISR has executed). The LED blinks for four times and the device enters Deep Sleep again.
5. Pressing the switch again repeats the wakeup cycle and the LED resumes blinking with the original interval of 1 second. With every interrupt and execution of ISR, the interval of blinking is alternated between 1 second and 500 milliseconds.

## Design and Implementation

PSoC 6 MCU is a dual-CPU architecture MCU with Arm® Cortex® M0+ (CM0+) and Arm Cortex M4 (CM4) CPUs. The CM0+ CPU enables the CM4 CPU on device reset. This code example uses a GPIO interrupt to wake the CM4 CPU from Deep Sleep. An LED is connected to an output pin and it is used for indicating the current state of the CPU. A blinking LED indicates that the CPU is active. After four successive blinks, the CPU is instructed to enter Deep Sleep. Because the GPIO state is retained during Deep Sleep, the LED stops blinking and stays OFF to indicate that the CPU is in Deep Sleep.

An input pin, externally connected to a switch, is configured to generate an interrupt when the switch is pressed. The interrupt triggers following two actions:

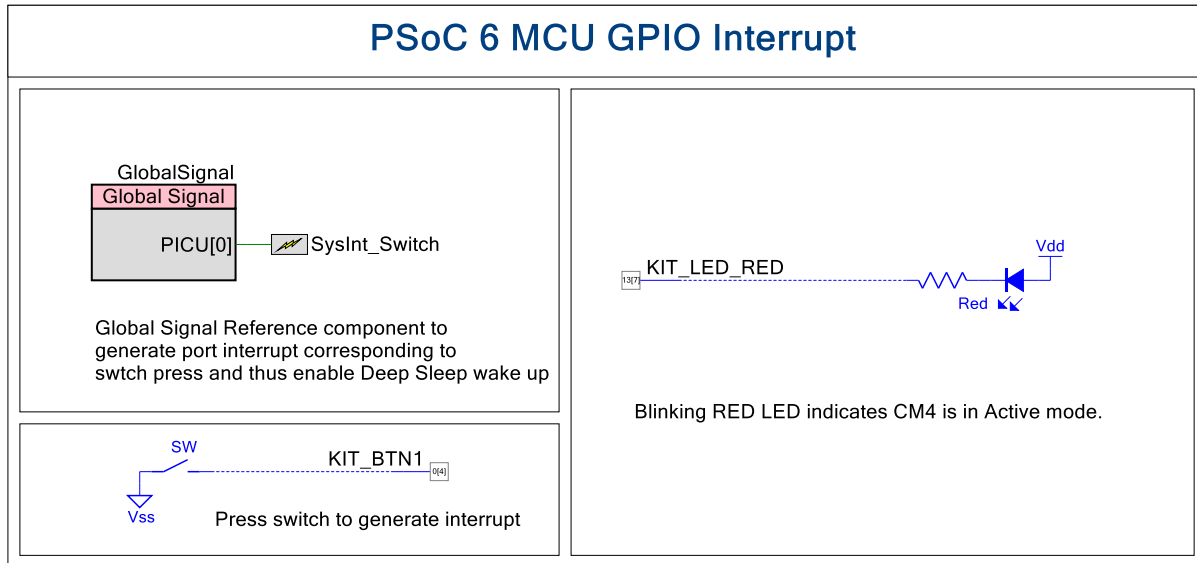

1. Generates a signal that wakes the CPU from Deep Sleep.

## 2. Executes an ISR.

When the ISR is executed, a flag is updated, which is used to change the rate of blinking the LED. With every press of the switch, the LED alternates blinking in intervals of 500 milliseconds and 1 second.

Figure 1 shows the PSoC Creator schematic of this code example. The project uses GPIO, Global Signal Reference, and SysInt Components.

Figure 1. PSoC Creator Project Schematic for GPIO Interrupt

## Design Considerations

The Global Signal Reference Component is used to route a Port Interrupt from the input pin. Port Interrupts are available in the Deep Sleep power mode and can thus wake up a CPU from Deep Sleep. The SysInt Component can also be connected to the pin directly as shown in Figure 2. This results in pin being used as a UDB Interrupt source. However, this interrupt signal is routed through Digital System Interconnect (DSI) and is not available during Deep Sleep and cannot wake up the CPU. For a list of Deep Sleep-compatible interrupt sources, see the "Interrupts" chapter in [PSoC 6 MCU Architecture TRM](#).

Figure 2. Direct Connection of Input Pin to SysInt Component

## Components and Settings

Table 1 lists the PSoC Creator Components used in this example, how they are used in the design, and the non-default settings required so they function as intended.

Table 1. PSoC Creator Components

Component	Instance Name	Purpose	Non-default Settings
Digital Output Pin	KIT_LED_RED	Provides visual feedback.	See <a href="#">Figure 3</a>
Digital Input Pin	KIT_BTN1	Provides a user interface.	See <a href="#">Figure 4</a>
Global Signal Reference	GlobalSignal	Provides connections to device-level global signals and shared resource Interrupts.	See <a href="#">Figure 5</a>
SysInt	SysInt_Switch	Provides an interface to connect hardware signals to a CPU interrupt request line.	Default

For information on the hardware resources used by a Component, see the Component datasheet.

Figure 3 to Figure 5 highlight the non-default settings for each Component in this example.

## Design-Wide / Global Resources

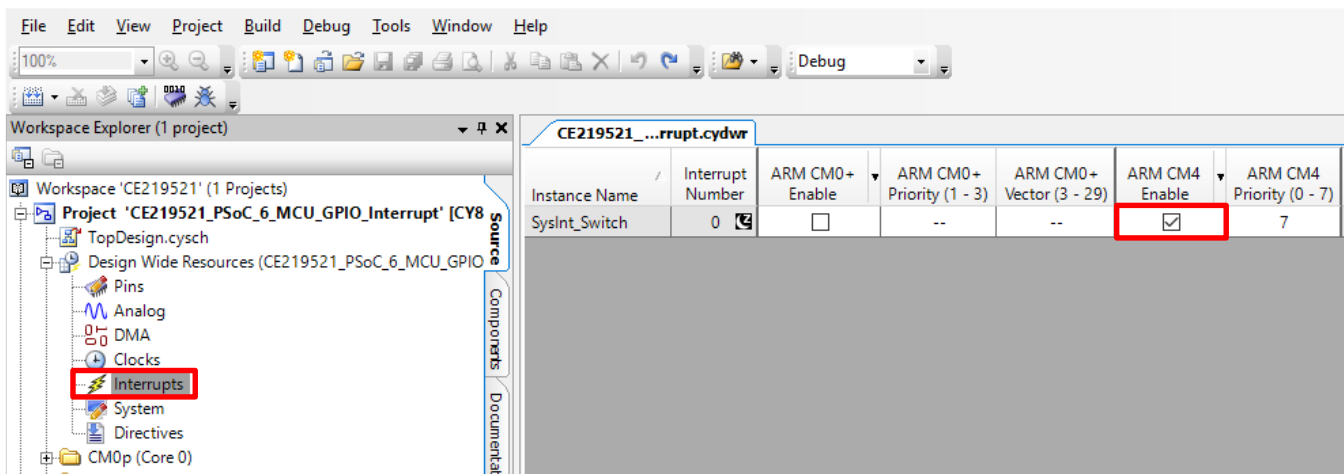

Table 2 shows the pin assignments for the switch and LEDs of [CY8CKIT-062 BLE](#).

Table 2. DWR Pin Assignment Table

Component	Instance Name	Pin
Digital Input Pin	KIT_BTN1	P0[4]
Digital Output Pin	KIT_LED_RED	P13[7]

Figure 6 shows the interrupt configuration for the project. Note that the SysInt Component is assigned to CM4 through the checkbox. Interrupt priority is left to its default value because there are no other interrupts. For more information on configuring interrupts using the DWR, see [AN217666 – PSoc 6 MCU Interrupts](#).
