

Please note that Cypress is an Infineon Technologies Company.

The document following this cover page is marked as “Cypress” document as this is the company that originally developed the product. Please note that Infineon will continue to offer the product to new and existing customers as part of the Infineon product portfolio.

Continuity of document content

The fact that Infineon offers the following product as part of the Infineon product portfolio does not lead to any changes to this document. Future revisions will occur when appropriate, and any changes will be set out on the document history page.

Continuity of ordering part numbers

Infineon continues to support existing part numbers. Please continue to use the ordering part numbers listed in the datasheet for ordering.

Objective

This example demonstrates how to use the PSoC® 6 MCU Multi-Counter Watchdog Timer (MCWDT) in watchdog mode.

Overview

The example starts an MCWDT counter in watchdog mode, clears the watchdog until a button is pressed, then the device is put into Deep Sleep mode. After the watchdog reset, an LED is flashed to confirm that the watchdog reset has occurred.

Requirements

Tool: PSoC Creator™ 4.2

Programming Language: C (Arm® GCC 5.4-2016-q2-update, ARM MDK 5.22)

Associated Parts: All PSoC 6 MCU parts

Related Hardware: CY8CKIT-062-BLE PSoC 6 BLE Pioneer Kit

Design

The design shown in Figure 1 has an MCWDT_PDL PSoC Creator Component (MCWDT_0). MCWDT_0 has two 16-bit counters (Counter0 and Counter1) and one 32-bit counter (Counter2). Counter0 is configured to generate an interrupt on match, with a period of 488 ms. If the interrupt occurs three times without being cleared, then the system is reset. Counter0 is clocked by LFCLK (nominal 32 kHz). Counter1 and Counter2 are not used. ERROR_REDLED indicates MCWDT_0 initialization status. RESET_GREENLED flashes at device start-up, due to POR, XRES, or MCWDT reset. INTR_BLUELED toggles if MCWDT_0 Counter0 interrupt is serviced.

Figure 1. MCWDT Watchdog Example Schematic

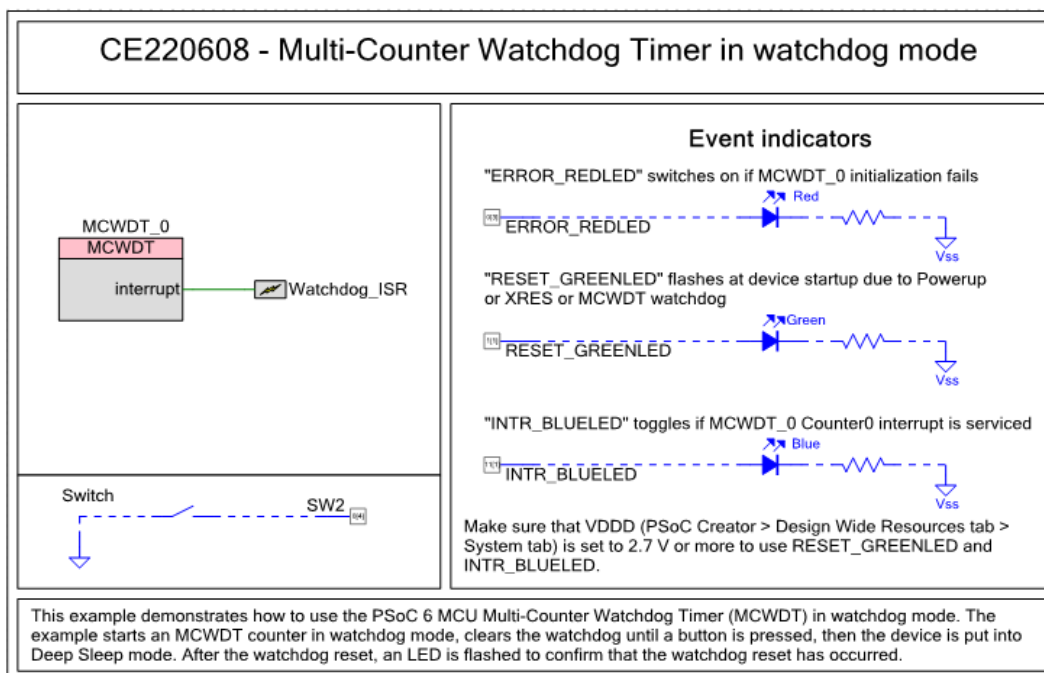

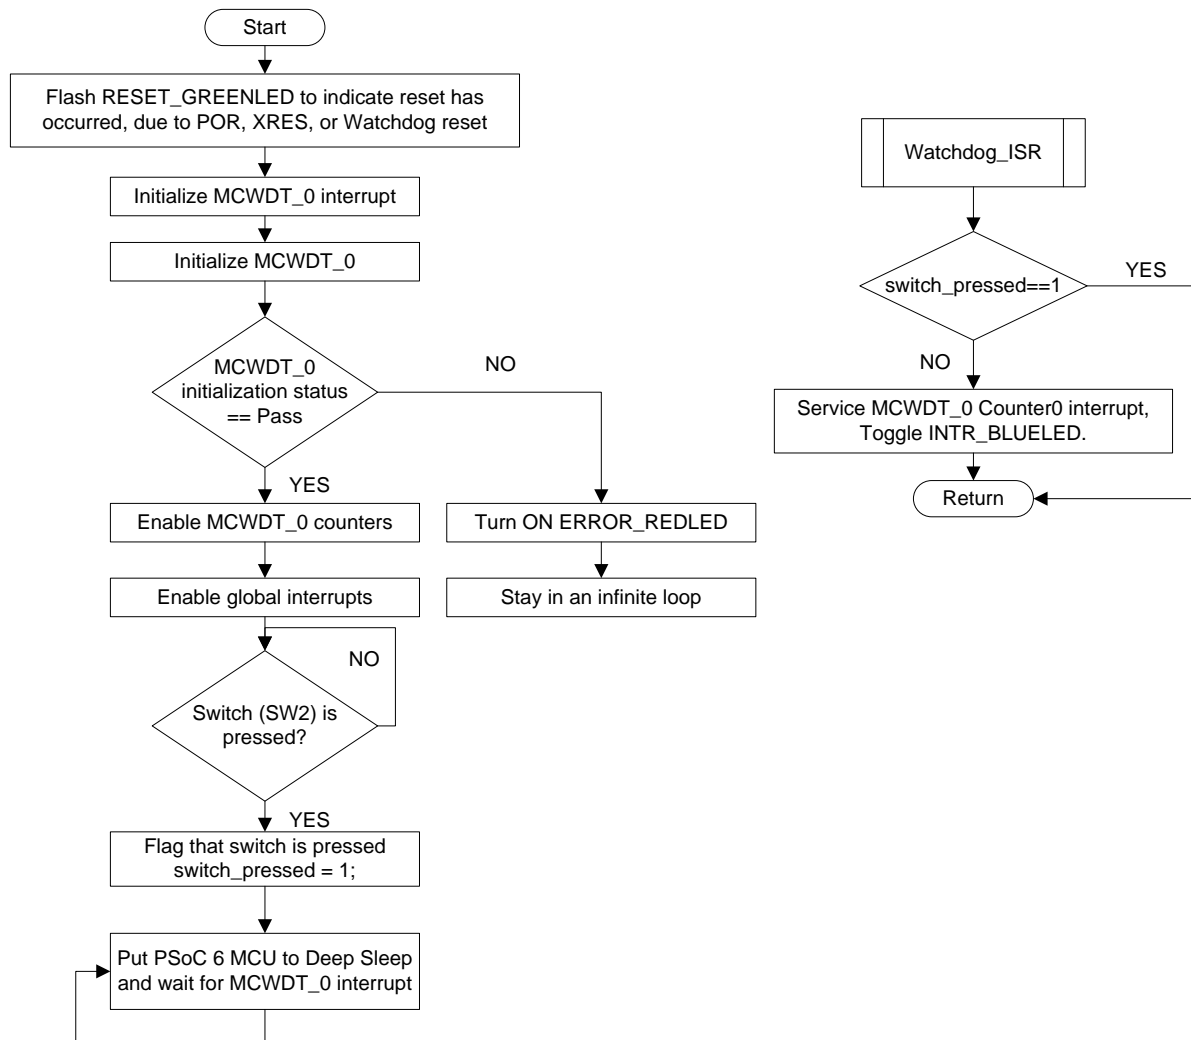

Figure 2 shows the firmware flowchart.

Figure 2. Firmware Flowchart

Design Considerations

This code example is designed to run on CY8CKIT-062-BLE with PSoC 6 MCU. To port the design to other PSoC 6 MCU devices and kits, change the target device in Device Selector, and change the pin assignments in the *cydwr* settings. For single-core PSoC 6 MCUs, port the code from *main_cm4.c* to *main.c* file because CM0+ CPU is not used in this code example.

Hardware Setup

The code example works with the default settings on the CY8CKIT-062-BLE PSoC 6 BLE Pioneer Kit. If the settings are different from the default values, see the “Selection Switches” table in the [kit guide](#) to reset to the default settings.

Make sure that the switch "SW5" is set to select "3.3V" as VDD on the CY8CKIT-062-BLE PSoC 6 BLE Pioneer Kit.

Operation

1. Connect CY8CKIT-062-BLE to a USB port on your PC.
2. Build and program the application into CY8CKIT-062-BLE. For more information on building a project or programming a device, see PSoC Creator Help.
3. Observe that RESET_GREENLED flashes to indicate a reset has occurred due to POR or XRES or watchdog reset.
4. Observe that INTR_BLUELED toggles to indicate that the MCWDT_0 Counter0 interrupt is serviced.
5. Press and release the switch (SW2) to make the firmware to stop servicing the MCWDT_0 Counter0 interrupt.
6. Observe that RESET_GREENLED flashes to indicate a reset has occurred due to POR or XRES or watchdog reset.

Components

Table 1 lists the PSoC Creator Components used in this example and the hardware resources used by each Component.

Table 1. PSoC Creator Components

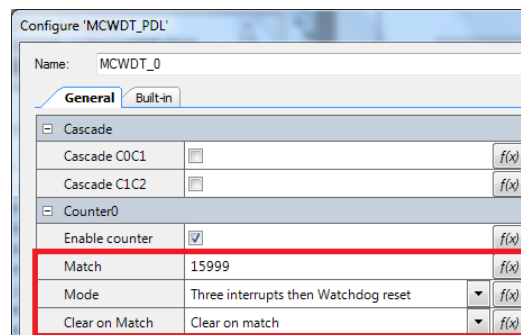

Component	Instance Name	Hardware Resources
Multi-Counter Watchdog (MCWDT_PDL)	MCWDT_0	One MCWDT block
System Interrupt (SysInt)	Watchdog_ISR	One entry in the device interrupt vector table
General-Purpose Input / Output (GPIO)	SW2, ERROR_REDLED, RESET_GREENLED, INTR_BLUELED	Four physical pins

Parameter Settings

Non-default settings for each Component is outlined in red in the following figure.

Figure 3 shows the MCWDT_0 Component parameter settings.

Figure 3. MCWDT_0 Component Parameter Settings

Design-Wide Resources

Make sure that V_{DD} (PSoC Creator > Design Wide Resources tab > System tab) is set to 2.7 V or more to use RESET_GREENLED and INTR_BLUELED.

Table 2 shows the pin assignment for the code example.

Table 2. Pin Names and Location

Pin Name	Location
ERROR_REDLED	P0[3]
INTR_BLUELED	P11[1]
RESET_GREENLED	P1[1]
SW2	P0[4]
