

Please note that Cypress is an Infineon Technologies Company.

The document following this cover page is marked as “Cypress” document as this is the company that originally developed the product. Please note that Infineon will continue to offer the product to new and existing customers as part of the Infineon product portfolio.

Continuity of document content

The fact that Infineon offers the following product as part of the Infineon product portfolio does not lead to any changes to this document. Future revisions will occur when appropriate, and any changes will be set out on the document history page.

Continuity of ordering part numbers

Infineon continues to support existing part numbers. Please continue to use the ordering part numbers listed in the datasheet for ordering.

Objective

This example demonstrates how to route Pulse-Density Modulation (PDM) audio data to the Inter-IC Sound (I²S) Interface in PSoC® 6 MCU.

Requirements

Tool: PSoC Creator™ 4.2, Peripheral Driver Library (PDL) 3.1.0

Programming Language: C

Associated Parts: All PSoC 6 MCU

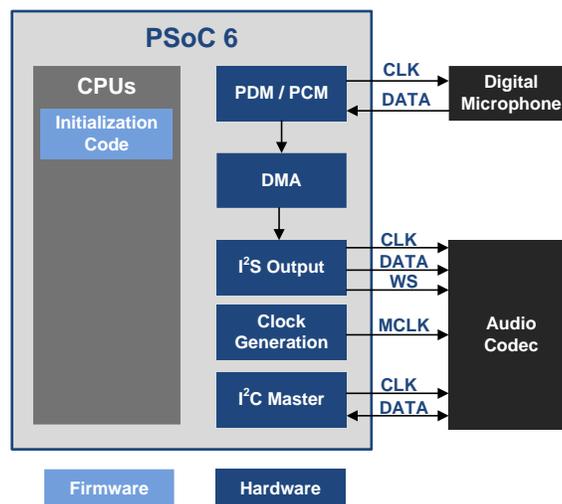

Related Hardware: CY8CKIT-062-WiFi-BT PSoC 6 WiFi-BT Pioneer Kit, TFT Display Shield Board CY8CKIT-028-TFT

Overview

This code example shows how to record a short audio sample from a microphone to SRAM, then play it on a speaker or headphone. The example uses DMA to transfer data from the PDM/PCM hardware block, which interfaces with a microphone, to SRAM. Once the recording is complete, another DMA transfers the recorded data to the I²S hardware block, which interfaces with an audio codec chip. This configuration frees the CPU completely, so it can execute other tasks.

Figure 1 shows the high level-block diagram of this application.

Figure 1. Block Diagram

Hardware Setup

This example requires the CY8CKIT-028-TFT shield to be connected to the CY8CKIT-062 (-BLE) kit.

Operation

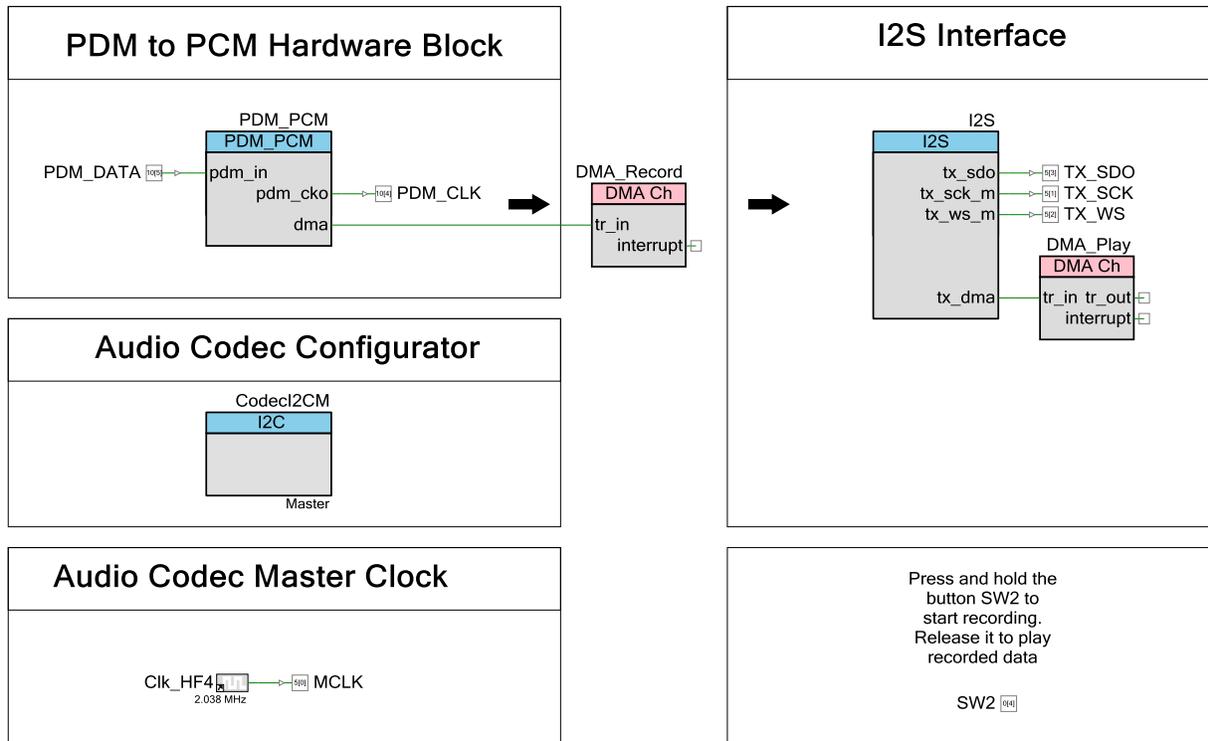

1. Connect the CY8CKIT-028-TFT shield to the CY8CKIT-062 kit.
2. Build the “CE220762_PDM_I2S” project and program the CY8CKIT-062 kit. For more information on building projects and device programming, see PSoC Creator Help.
3. Connect a headphone or speaker to the audio jack of the CY8CKIT-028-TFT shield.

4. Press the CY8CKIT-062 SW2 button and hold it. Speak over the microphone to record a short message (up to 4 seconds).
5. Release the SW2 button and listen the recorded data with the headphone or speaker.

Design and Implementation

Figure 2 shows the PSoC Creator schematic of this code example.

Figure 2. Project Schematics

The [CY8CKIT-028-TFT](#) shield contains the audio codec [AK4954A](#), an audio jack and a digital microphone. This allows you to record data using the microphone and play it with the audio codec. You can connect a speaker or headphone to the audio jack.

The first stage is to record any sound coming from the microphone and place it in the SRAM of PSoC 6 MCU. This whole process can be achieved using DMA to transfer from the PDM/PCM RX buffer to an array allocated in the SRAM. Once the sound is recorded, another DMA Component move data from the SRAM to the I²S TX buffer.

To record a longer audio stream from the microphone, a sample rate of only 8 ksp/s is configured in both components – PDM/PCM and I²S. Both the word length of the PCM data output and the I²S TX buffer data size are set to 16 bits. The number of elements allocated for the recorded data array is 65,536, consuming a total of 128 Kbytes of SRAM.

PSoC 6 MCU also generates the clock fed to the audio codec. Based on the AK4954A datasheet, this codec requires a minimum MCLK 256x the frame rate (256 × 8 ksp/s), which translates to a 2.048-MHz clock. The code example contains an I²C Master, through which PSoC 6 MCU configures the audio codec. The code example provides an API to easily configure the AK4954A codec.

Figure 3 shows the flowchart diagram of the steps in this example.

Figure 3. Flowchart Diagram

For more details on the I²S and PDM/PCM interfaces, refer to the Architecture [TRM](#) of the device.

Components and Settings

Table 1 lists the PSoC Creator Components used in this example.

Table 1. List of PSoC Creator Components

Component	Instance Name	Purpose	Non-default Settings
I2S	I2S	Stream data to the audio codec	See Figure 4 .
I2C (Master)	Codecl2CM	Configures the audio codec	All default
Clock	HFClk4	Generates the audio codec master clock	Clock Type: Existing Source: Clk_HF4
PDM/PCM	PDM_PCM	Interfaces with the PDM microphone	See Figure 5 .
DMA	DMA_Record	Transfers data from the PDM/PCM RX Buffer to the SRAM	See Figure 6 .
DMA	DMA_Play	Transfers data from the SRAM to the I ² S TX buffer	See Figure 7 .
Digital Output Pin	MCLK	Drives the audio codec master clock	All default
Digital Output Pin	TX_SDO	Drives the audio data line from the I ² S interface	All default
Digital Output Pin	TX_SCK	Drives the audio clock line from the I ² S interface	All default
Digital Output Pin	TX_WS	Drives the word select line from the I ² S interface	All default
Digital Input Pin	PDM_DATA	Collects the PDM microphone data	All default
Digital Output Pin	PDM_CLK	Drives the PDM microphone clock	All default
Digital Input Pin	SW2	Handles the kit's switch	Drive mode: Resistive Pull Up

Parameter Settings

This section shows the changed settings for various Components as well as the system clocks.

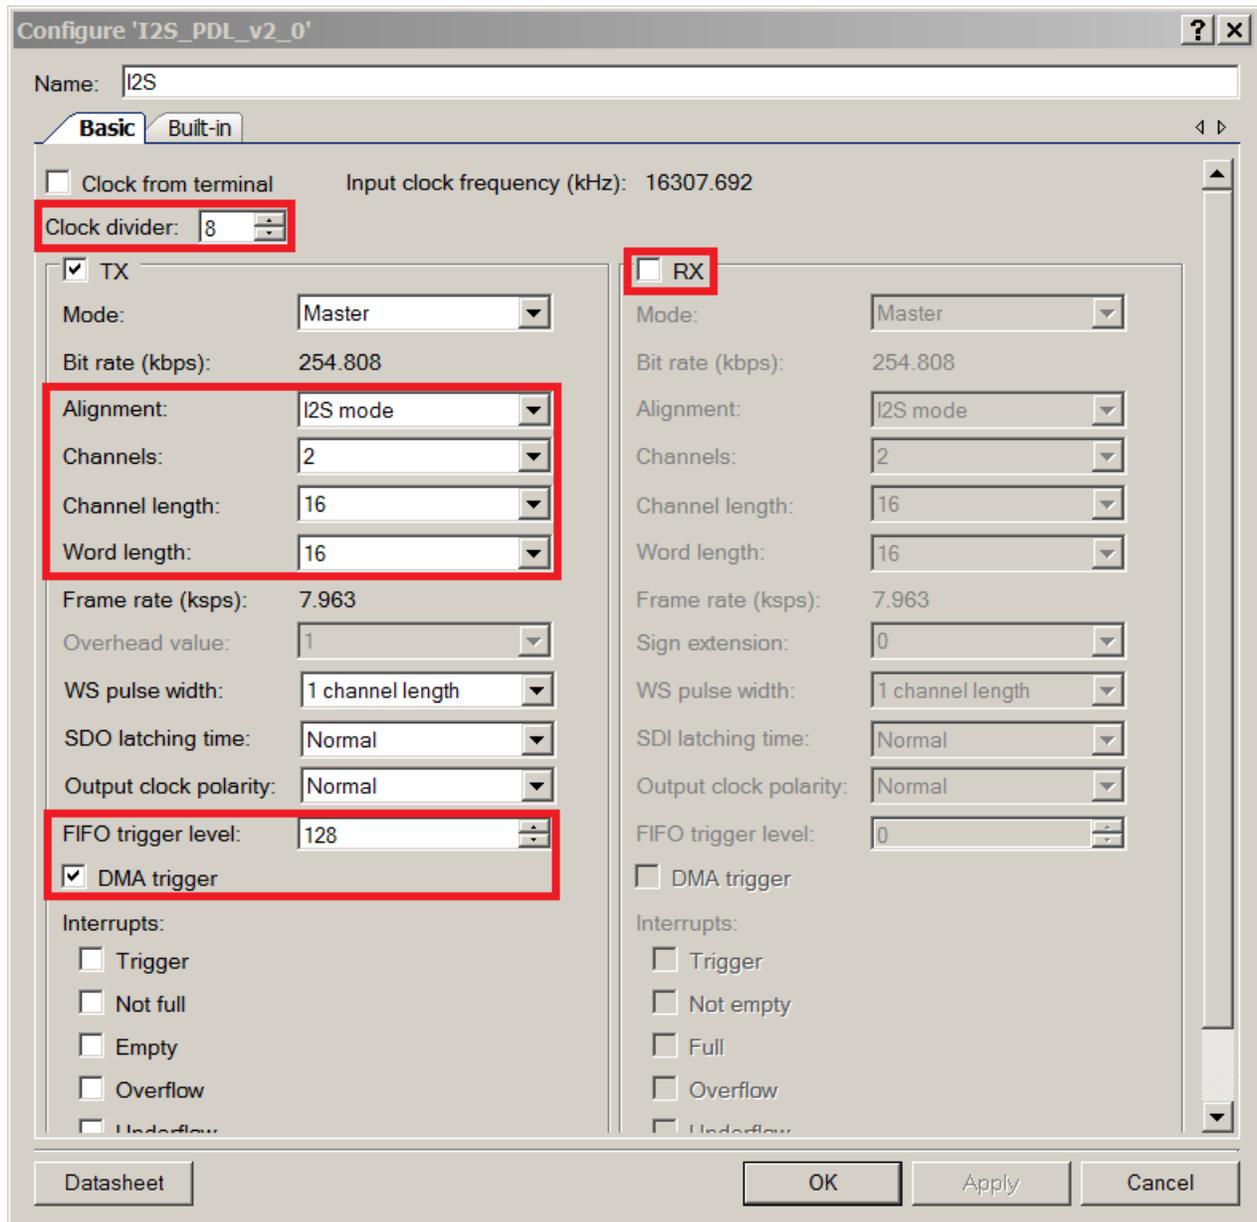

I2S

The I2S Component is configured for a frame rate of 8 ksps. Configure the HFClk1 clock to a specific frequency (see below). The Input clock frequency displayed in the Component is derived from HFClk1. The frame rate is calculated as follows:

$$\text{Frame Rate (ksps)} = \frac{\text{HFClk1}}{\text{Clock divider} \times 16 \times \text{Channel Length}}$$

[Figure 4](#) shows the I2S configuration window. Note that the frame rate is not exactly 8 ksps because the PLL cannot achieve the desired output frequency of 16.384 MHz.

Figure 4. I2S Component Configuration Window

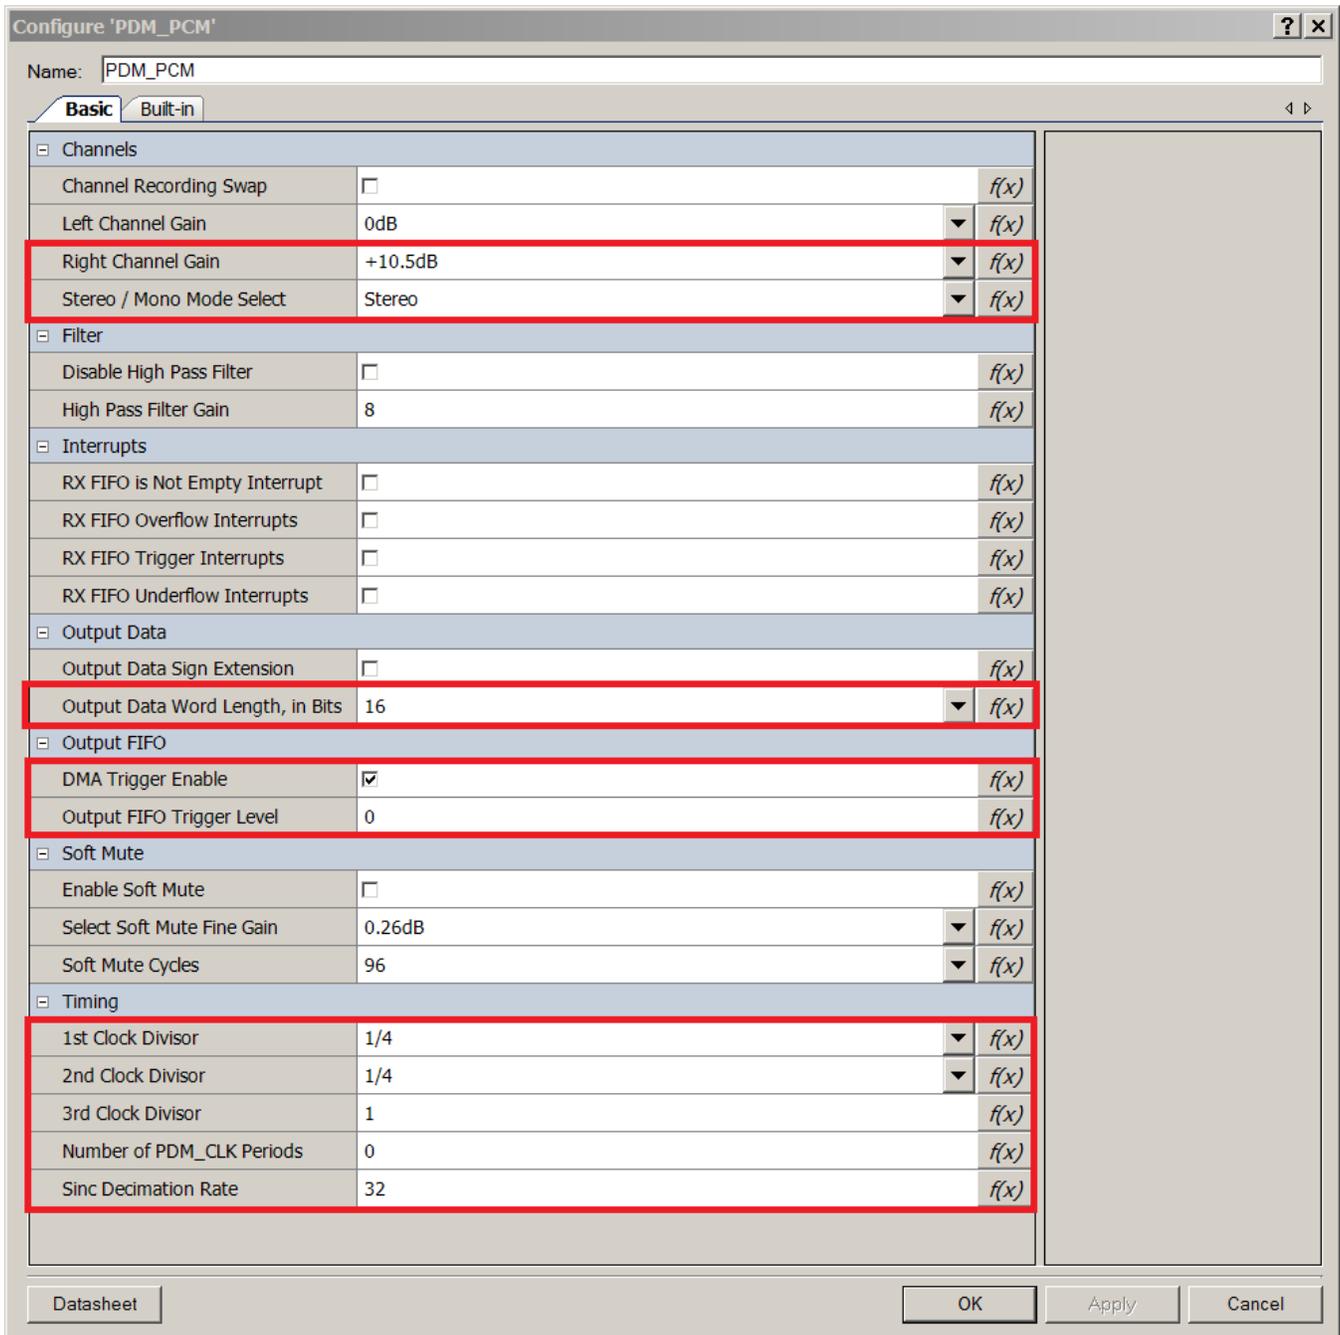

PDM_PCM

The PDM_PCM Component is configured for a frame rate of 8 ksps. The frame rate for this component is calculated as follows:

$$\text{Frame Rate (ksps)} = \frac{HFCLK1}{1\text{st Clock Divisor} \times 2\text{nd Clock Divisor} \times (3\text{rd Clock Divisor} + 1) \times 2 \times \text{Sinc Decimation Rate}}$$

Figure 5 shows the configuration window.

Figure 5. PDM/PCM Component Configuration Window

HFCIK4

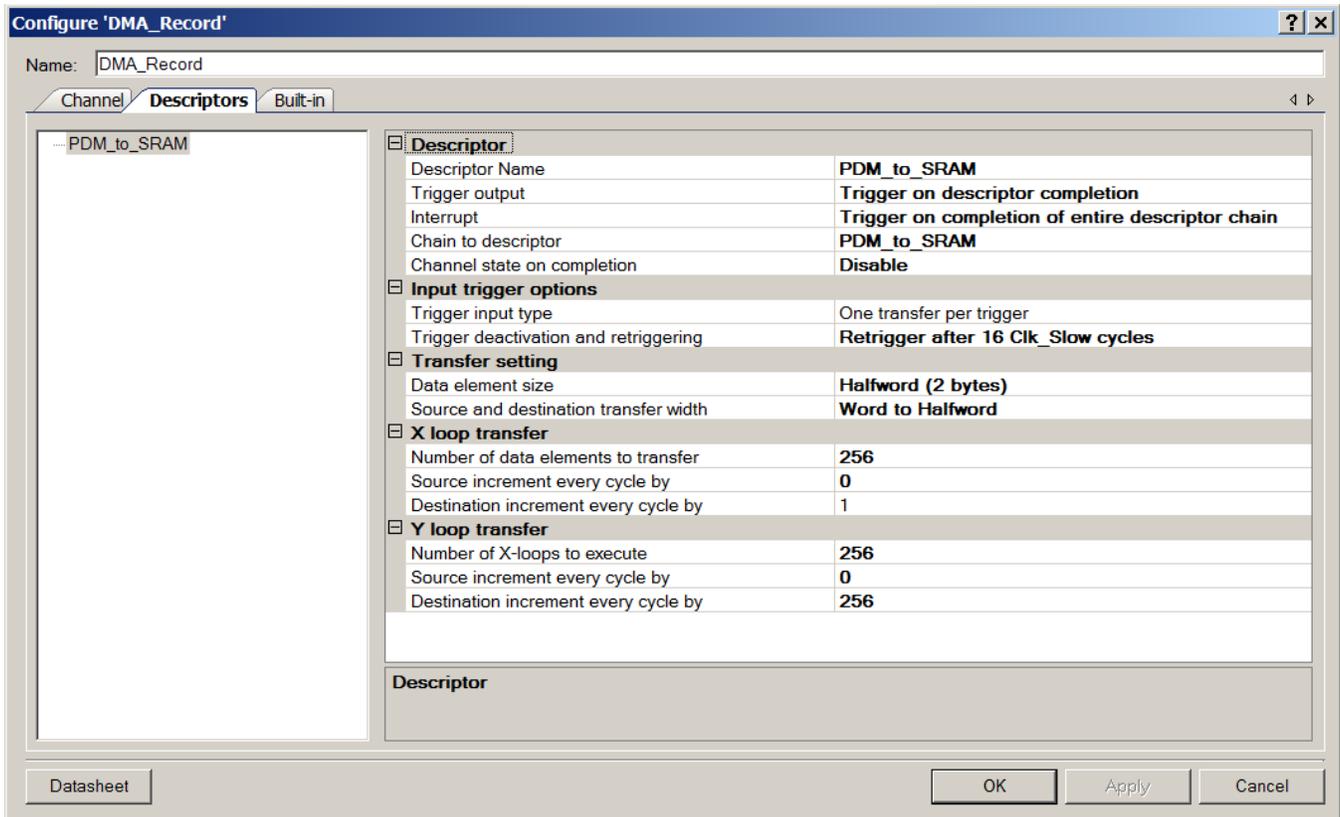

The Component clock is configured to be 2.048 MHz, which is sourced from the PLL output and divided by 8.

DMA_Record

This DMA is configured to transfer data from the PDM RX Buffer to the recorded data array placed in SRAM. When enabled, it triggers when there is at least one element in the PDM RX Buffer.

Figure 6 shows the configuration window of this DMA.

Figure 6. DMA_Record Configuration Window

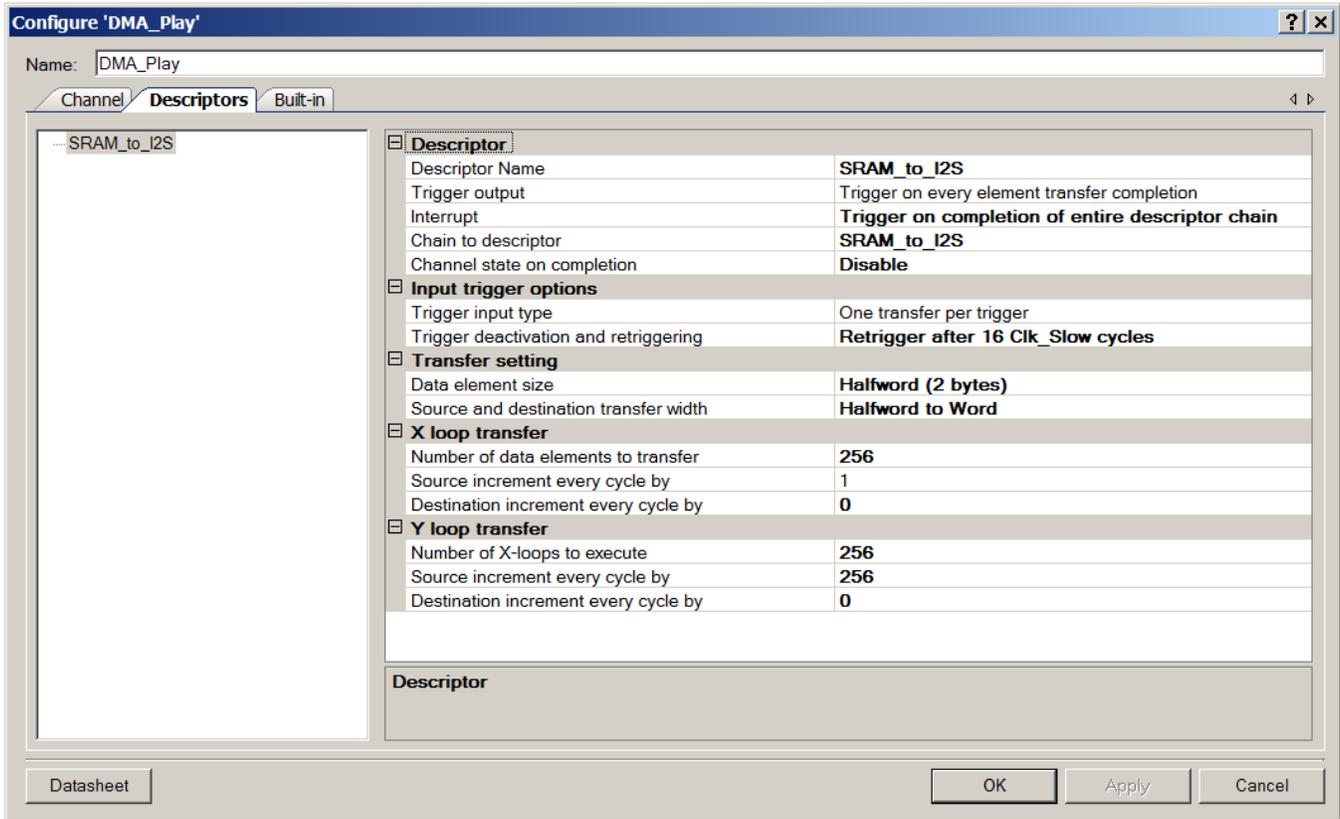

Note that the maximum number of elements to transfer in each loop is 256.

DMA_Play

This DMA is configured to transfer data from the recorded data array placed in SRAM to the I²S TX Buffer. When enabled, the DMA triggers when the I²S buffer has less than 128 elements.

Figure 7 shows the configuration window of this DMA.

Figure 7. DMA_Play Configuration Window

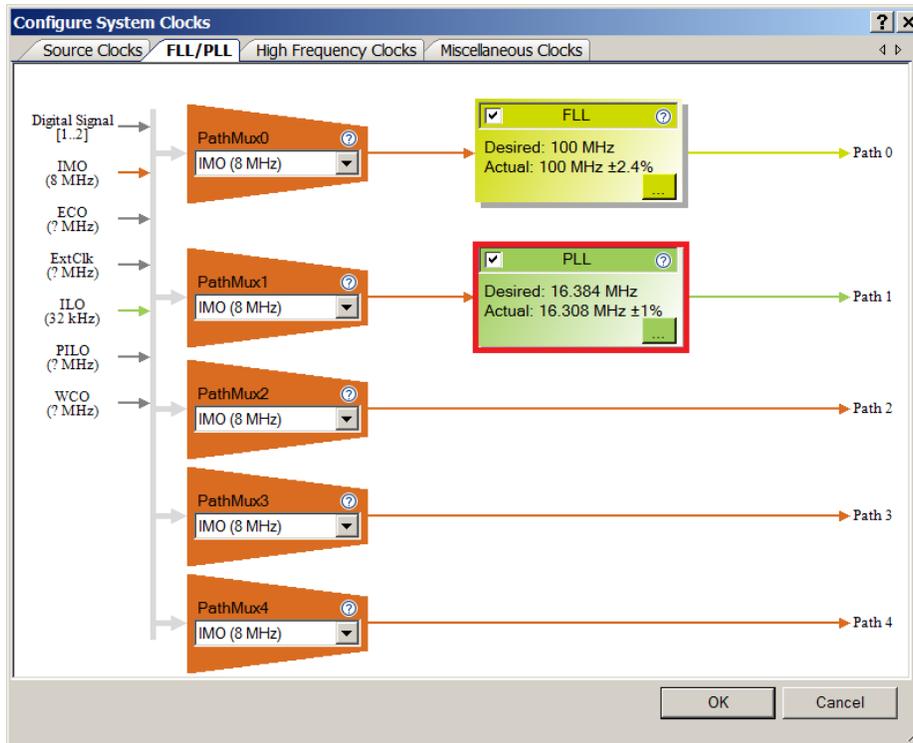

Design-Wide Resources

In the FLL/PLL tab, enable the PLL to be 16.384 MHz. This clock frequency comes from the following equation:

$$HFClk1 = \text{Frame Rate} \times \text{I2S Clock divider} \times 16 \times \text{Channel Length} = 8k \times 8 \times 16 \times 16 = 16384 \text{ kHz}$$

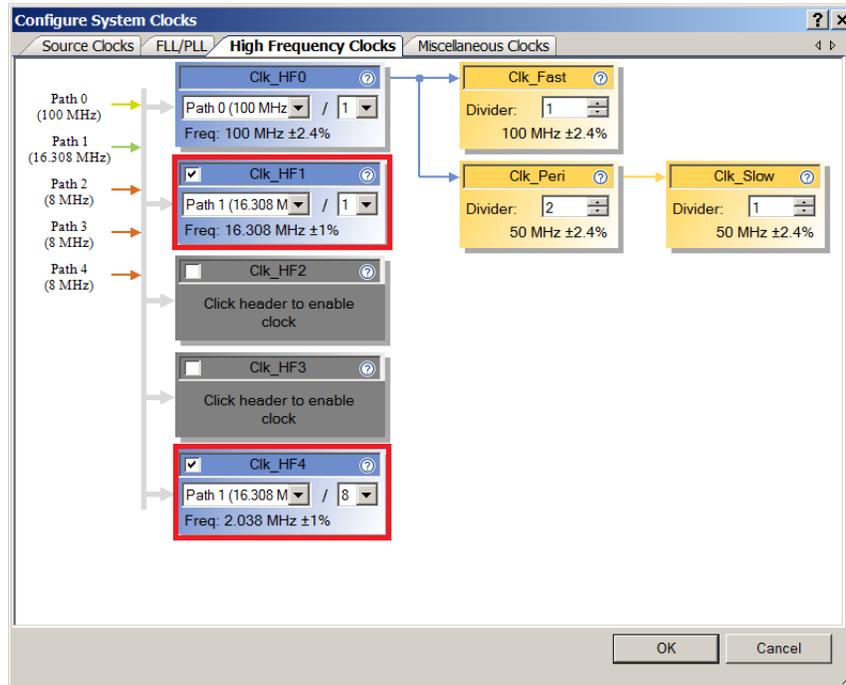

Figure 8 shows the configuration of the PLL. Note that the actual frequency is 16.381 MHz, instead of the desired frequency of 16.384 MHz.

Figure 8. Clock Configuration Window

Configure the High Frequency Clocks HFCIk1 and HFCIk4 to be linked to Path 1. Note that ideally both the clocks created for the I2S block (MCLK and TX_CLK) should come from the same source. Figure 9 shows how the high-frequency clocks are configured.

Figure 9. High Frequency Clock Configuration

Reusing This Example

This code example runs on CY8CKIT-062-BLE or CY8CKIT-062 kits, which have a PSoC 6 MCU device. To port the design to other PSoC 6 MCU devices and kits, change the target device in **Project > Device Selector**, and update pin assignments in the Design Wide Resources. For single-core PSoC 6 MCU devices, port the code from *main_cm4.c* to *main.c*.
